FOREWORD

Mauritius has been consistently ranked as the top performer in Africa in terms of sexual reproductive health programme including family planning programme. Since independence, Mauritius being a welfare state has sustained the provision of health services to all citizens, free of user cost. Health facilities are relatively well distributed all over the country to provide adequate access to primary, secondary and tertiary care services. These services include sexual and reproductive health including family planning. Family planning has empowered women with respect to both their productive and reproductive rights and is playing a crucial role to attain the Sustainable Development Goals particularly 3, 4 and 5 which are health related.

The COVID-19 pandemic is having a catastrophic impact on women and girls globally. We cannot forget the women and girls even during a pandemic. Maternal healthcare services and access to contraceptives are not optional - these are essential services that must be maintained. In Mauritius we achieved the optimal balance between fighting the COVID-19 pandemic and maintaining the sexual and reproductive health services.

The Family Planning and Demographic Yearbook presents data on population trends and family planning use and accessibility, amongst others, for both Island of Mauritius and Island of Rodrigues. This yearbook is intended for planners, policy makers, and the general public.

The data presented in the yearbook has been obtained from the different departments of this Ministry (the Primary Health Care Division, the Health Statistics Unit, the Health Records Division, and the Human Resource Section) as well as from Statistics Mauritius and the non-governmental organisations, namely Mauritius Family Planning and Welfare Association and Action Familiale.

The yearbook has been published by the Demographic/Evaluation Unit of the Ministry of Health and Wellness, which is responsible for monitoring and evaluating the national family planning programme, and its present issue is the forty-sixth volume.

Special thanks go to the staff of the Demographic/Evaluation Unit of this Ministry for their assistance in the compilation of this yearbook and to the staff of other departments and organisations for providing statistics that have been published in this yearbook.

J. Sunkur
Chief Demographer

A SUMMARY ON THE DEMOGRAPHIC AND FAMILY PLANNING STATISTICS

A summary of the statistics presented in the 2020 Family Planning and Demographic Yearbook is given in this section. The 2020 Yearbook is the forty-sixth volume and provides statistics for Island of Mauritius and Island of Rodrigues on demography as well as on family planning for the government and the two non-governmental organisations, namely Mauritius Family Planning and Welfare Association and Action Familiale. The tables and charts in this volume have been grouped under the following headings: population, vital statistics, and family planning.

ISLAND OF MAURITIUS

CENSUS

The last two censuses have been carried out in 2000 and 2011, and the *de jure*¹ counts revealed that there were 1,143,069 inhabitants and 1,196,383 inhabitants respectively, and that the population density has increased from 613 inhabitants per square kilometre in 2000 to 642 in 2011 (*Table A.1*). Moreover, it is noted that the average annual population growth rate of 0.42% for the period 2000-2011 was lower than the annual growth rate of 1.12% for the earlier intercensal period 1990-2000.

POPULATION SIZE, GROWTH AND DISTRIBUTION

The estimated resident population was 1,221,921 as at 1st July 2020, thus showing a decrease of 419 persons since 1st July 2019 (*Table A.4*). Moreover, the estimated mid-year population in 2020 shows that there were more females than males: 617,361 females and 604,560 males.

¹ A population enumerated on the basis of normal residence, excluding temporary visitors but including residents temporarily absent.

In 2020, an estimate of 42% of the population lived in urban areas and 58% lived in rural areas.

SEX RATIO

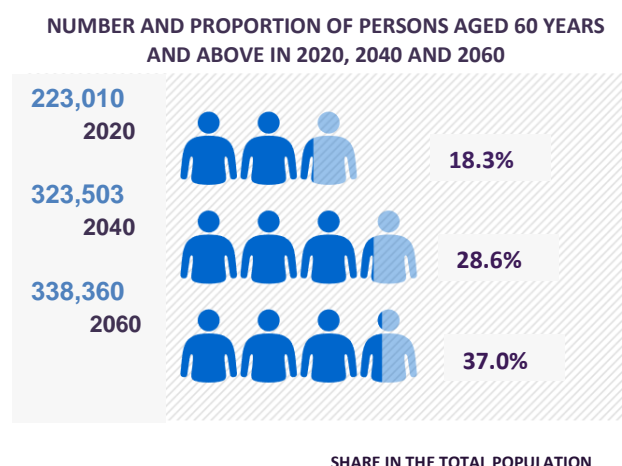

The sex ratio is a measure used to describe the balance between males and females in a population. In 2020, the sex ratio of the total population was 97.9 males per 100 females.

Due to the 'female survival advantage' in life expectancy, there are more females in the older age groups than in the younger age groups, and the gap increases with age. For instance, in 2020, there were 80.7 men per 100 women in the age group 60 and above and 54.6 men per 100 women in the age group 80 and above (*Chart 4*).

CHANGING AGE STRUCTURE

The population of Mauritius is ageing due to sustained low fertility level and increasing life expectancy, which in turn is resulting to lower proportion of children and higher proportion of elders in the population. The ageing index shows that there were about 109 elders aged 60 years and above for every 100 children younger than 15 years old in 2020. Hence, as the population is growing older, Mauritius is witnessing a change in its age structure.

The proportion of the population aged 60 years and above has increased from 9.1% of the total mid-year population in 2000 to 18.3% in 2020, and it is projected² to increase to 28.6% in 2040 and 37.0% in 2060 (*Chart 11*).

² Medium variant projection based on 2020 population.

Conversely, the proportion of the population aged 0-14 years has decreased from 25.0% of the total mid-year population in 2000 to 16.7% in 2020, and it is projected to decrease to 13.6% in 2040 and 11.1% in 2060. The proportion of the population aged 15-59 years has remained almost constant (65.8% of the total mid-year population in 2000 and 65.0% in 2020), and it is projected to decrease to 57.9% in 2040 and 51.9% in 2060.

MEDIAN AGE OF THE POPULATION (IN YEARS)

Changes in the age structure are also reflected in the median age of the population; 50% of the population is older than this age and 50% is younger. The median age of the population has increased from 29.4 years in 2000 to 37.6 years in 2020, and it is projected to increase to 45.4 years in 2040 and 51.9 years in 2060.

Mauritius is also witnessing a progressive ageing of its older population. The share of persons aged 80 years or older in the elderly population (aged 60 years and above) is projected to increase from 11.2% in 2020 to 21.1% in 2060 (Chart 12). In other words, 1 in 9 elderly persons (aged 60 years or older) was 80 years or older in 2020, and this ratio is projected to be 1 in 5 in 2060.

Population pyramids are useful in examining the age-sex structure of a population. The juxtaposed population pyramids for year 2020 and 2060 show that due to the projected rise in the number and proportion of old people in the population, the apex of the 2060 pyramid is broader than that of the 2020 pyramid (Chart 9). Moreover, based on the projected changes in the age structure, there will be an increasingly demand for healthcare services for the elderly.

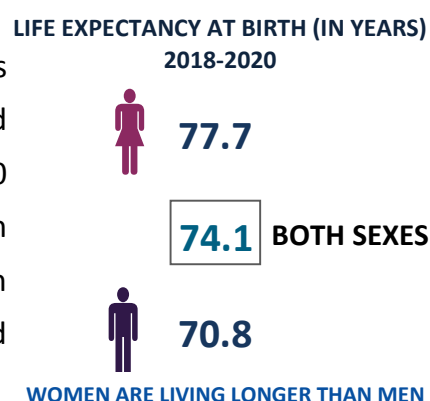

Another ramification of the changes in the age distribution is that the total dependency ratio will continue to increase. The total dependency ratio compares the number of dependents (children aged 0-14 years and elders aged 60 years and above) to the number of persons of working age (i.e. 15-59 years); a higher ratio indicates a higher burden on the working age population. The total dependency ratio has increased from 519.2 dependents per 1000 persons of working age in 2000 to 537.5 in 2020, and it is projected to increase to 728.5 in 2040 and 927.8 in 2060 (Table A.11).

WOMEN IN THE REPRODUCTIVE AGE GROUP (15-49 YEARS)

The number and proportion of women in the reproductive age group (15-49 years) are important demographic factors to consider in a reproductive health (including family planning) programme. The share of women in the reproductive age group (15-49 years) in the total mid-year female population was 49.6% in 2020, and it is projected to decrease to 41.8% in 2040 and 34.1% in 2060 (Chart 13).

LIFE EXPECTANCY

Life expectancy at birth has improved considerably and is expected to improve further over the years. It increased from 69.3 years in 1989-1991 to 74.1 years in 2018-2020 (Table A.7). Likewise, female life expectancy at birth increased from 73.4 years in 1989-1991 to 77.7 years in 2018-2020 and male life expectancy at birth increased from 65.6 years in 1989-1991 to 70.8 years in 2018-2020.

Life expectancy at birth is higher for females than for males but the gap between male and female life expectancy at birth is narrowing. The above-mentioned figures show that a girl born in 1989-1991 could expect to live 7.8 years longer than a boy born in the same period, and for a girl born in 2018-2020, she could expect to live 6.9 years longer.

Life expectancy at age 60 for the total population was 20.5 years in 2018-2020, and women aged 60 years in 2018-2020 could expect to live an additional 22.3 years, compared with 18.6 years for men aged 60 years in the same period.

VITAL STATISTICS

There were 12,554 live births and 10,768 deaths that were registered in 2020, resulting in a natural increase of 1,786 (live births minus deaths). Moreover, in 2020, there were 498 more live births and 143 less deaths than in 2019 (Table B.2).

The crude birth rate has declined from 11.6 births per 1,000 mid-year population in 2011 to 10.3 in 2020, and the crude death rate has increased from 7.4 deaths per 1,000 mid-year population in 2011 to 8.8 in 2020. Hence, the rate of natural increase was 4.2

in 2011 and 1.5 in 2020. Moreover, it is noted that the crude birth rate for the five-year period has declined, from 10.8 in 2011-2015 to 10.1 in 2016-2020. As for the crude death rate, it has fluctuated between 7.4 and 8.9 during the period of 2011-2020.

The infant mortality rate is often used as a proxy measure of the overall health of the population. There were 184 infant deaths (deaths under 1 year of age) that were registered in 2020, resulting to 11 more infant deaths than in 2019. The infant mortality rate has increased from 12.6 deaths per 1,000 live births in 2011 to 14.7 in 2020, resulting in an increase of 16.7%. However, it is to be noted that the infant mortality rates for the five-year period 2011-2015 and 2016-2020 have remained the same (i.e. 13.2).

The neonatal mortality rate is a key outcome indicator for newborn care and directly reflects prenatal, intrapartum, and neonatal care. During the period of 2011-2020, the neonatal mortality rate has fluctuated between 7.6 and 10.5 deaths per 1,000 live births; in 2020, this rate was 10.1. Neonatal deaths (deaths of babies under 28 days of age) accounted for 69.0% of all infant deaths in 2020.

The number of still births was 132 in 2020 and has not changed significantly from the 2019 figure (131). The still birth rate has fluctuated between 8.7 and 10.7 during the period of 2011-2020; the lowest rate ever-recorded was in 2013. In 2020, the still birth rate was 10.4 still births per 1,000 total births.

The under-five mortality rate is a leading indicator of child health and overall human development. The under-five mortality rate (deaths of children under five years of age) has decreased from 15.6 deaths per 1,000 live births in 2011 to 15.5 in 2020, resulting in a decrease of 0.64%. Moreover, the data shows that the under-five year mortality rate for the five-year period has declined, from 15.3 in 2011-2015 to 14.9 in 2016-2020.

There has been a marked improvement in maternal health especially in the second half of the twentieth century (*Table B.3*). For instance, the maternal mortality ratio declined from 1.26 maternal deaths per 1,000 live births in 1986 to 0.15 in 2000.

Factors such as strengthening and expanding the maternal and child health services, accessibility to family planning services, and contraceptive use have been associated with this declining trend.

In 2020, the maternal mortality ratio was 0.64 maternal deaths per 1,000 live births (or 64 maternal deaths per 100,000 live births). It is noted that the maternal mortality ratio (i.e. maternal deaths per 1,000 live births) has fluctuated between 0.33 and 0.79 during the ten-year period of 2011 to 2020. As part of the renewed commitment from the government to improve further the reproductive health indicators, policies and strategies have been formulated and are being implemented.

VITAL STATISTICS BY DISTRICT³

In 2020, the crude birth rates ranged from 8.0 in Flacq to 14.3 in Port Louis (*Table B.4*). Five districts had higher rates (Port Louis, Pamplemousses, Rivière du Rempart, Savanne and Black River) than the national level of 10.3.

In 2020, the crude death rates ranged from 6.4 in Black River to 11.6 in Port Louis (*Table B.5*). Two districts had higher rates (Port Louis and Plaines Wilhems) than the national level of 8.8.

In 2020, the still birth rates ranged from 4.2 in Savanne to 12.9 in Pamplemousses (*Table B.6*). Three districts had higher rates (Port Louis, Pamplemousses and Plaines Wilhems) than the national level of 10.4.

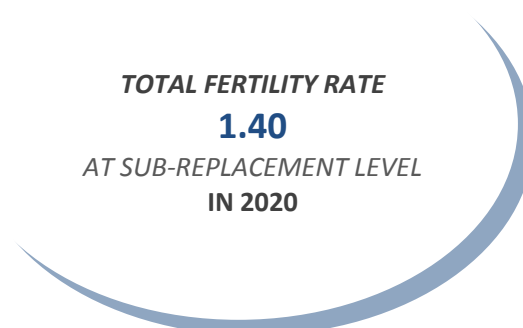

In 2020, the infant mortality rates ranged from 8.1 in Flacq to 19.6 in Port Louis (*Table B.7*). Four districts had higher rates (Port Louis, Pamplemousses, Grand Port and Black River) than the national level of 14.7.

³ Island of Mauritius is divided into nine districts (see map).

FERTILITY

There has been a remarkable decline in fertility in the past few decades as measured by the total fertility rate. The total fertility rate is the average number of babies that a woman could expect to bear if current fertility rates prevail throughout her reproductive lifetime. The total fertility rate dropped sharply from 5.86 children per woman in 1962 to 3.42 in 1972 and continued to drop further thereafter.

The total fertility rate dropped below the replacement-level fertility of 2.10 children per woman - the level needed for a woman to replace herself and her partner - for the first time in the mid-1980s; however, it was not until 1997 onward that fertility has continuously been at sub-replacement level. In 2020, the total fertility rate was 1.40 children per woman compared with 1.53 in 2011, resulting in a decrease of 8.5%. Interestingly, an increase in the total fertility rate has been noted from 1.35 in 2019 to 1.40 in 2020 (*Table B.8*) – the year where the Covid-19 pandemic was declared.

In 2020, women in the age-groups 15-19, 20-24 and 25-29 had lower fertility rates than women in the same age group in 2011 (*Table B.9*), and the largest percentage decrease in fertility rates were among women aged 20-24 years (36.3%).

Early childbearing increases health risks for both mothers and their newborns. The fertility rate for women aged 15-19 years (adolescent fertility rate) has declined from 30.4 in 2011 to 21.7 in 2020, resulting in a decline of 28.6%. Even though progress has been made in reducing the fertility rate among adolescents, it is noted that 20 live births occurred to adolescents under 15 years of age in 2020.

In 2020, the age-specific fertility rates showed that women *aged 25-29 years* had the *highest* fertility rate (82.7) among all age groups, and that women *aged 30-34 years* (79.8) and women *aged 20-24 years* (51.7) had the *second* and *third* highest fertility rate respectively (*Table B.9*).

The median age of childbearing has increased from 28.8 years in 2019 to 29.0 years in 2020.

NUPTIALITY

Island of Mauritius

The 1962 and 1972 censuses showed that the proportion of currently married women in the age group 15-19 declined by slightly more than half, from 27.8% in 1962 to 12.5% in 1972 (*Table A.3*) whilst the average number of children per woman dropped from about 6 to 3 in the same period. Factors that have been linked to this sharp reduction in fertility between 1962 and 1972 include, among others, the postponement of marriage among younger women and contraceptive use. The last census, which was carried out in 2011, revealed that the proportions of currently married women in the age group 15-19 and 20-24 were 6.3% and 34.8% respectively.

The crude marriage rate has declined from 17.1 marriages per 1,000 mid-year population in 2011 to 11.0 in 2020, resulting in a drop of 35.7%. There were 6,735 marriages that were registered in the Island of Mauritius in 2020, and the majority of brides (83.6%) and bridegrooms (85.0%) had never been married before.

The median age of females and males at first marriage was 27.20 years and 29.98 years respectively in the Island of Mauritius in 2020. The median age at first marriage for females has decreased by 0.29 years since 2019 and the median age at first marriage for males has decreased by 0.24 years since 2019.

The data shows that 2,088 divorces and 1,921 divorces have been granted in 2019 and 2020 respectively in the Island of Mauritius. The crude divorce rate ranged between 2.5 to 3.8 during the period of 2009-2020 (*Chart 18*). In 2020, the crude divorce rate was 3.1 divorces per 1,000 mid-year population. Overall, 63.1% of all couples granted divorce in 2020 had at least one dependent child.

Moreover, there has been a significant decrease in the number of marriages that was registered in the Island of Mauritius, from 9501 in 2019 to 6735 in 2020 due to the Covid-19 pandemic.

FAMILY PLANNING

Availability

Family planning helps save women's and children's lives by preventing unplanned pregnancies. Family planning services, including contraceptives, have been available to individuals and couples, free of user cost at government health service points since 1968.

The government family planning programme provides a wide range of short-term and long-term contraceptive methods⁴ through a network of health service points.

FAMILY PLANNING BENEFITS
<ul style="list-style-type: none">• Advances human rights• Saves lives• Prevents HIV/AIDS transmission• Helps reduce poverty• Advances gender equality and empowerment• Supports the achievement of the sustainable development goals (SDGs)

However, availability of family planning services in Mauritius dates back since 1957 when the non-governmental organization (NGO) Mauritius Family Planning and Welfare Association (MFPWA) was set up. The MFPWA family planning programme was then integrated with the government maternal and child health programme in 1972, and thereafter, MFPWA has continued to run a family planning clinic where contraceptive methods and counselling services are offered. Moreover, the NGO Action Familiale, which was established in 1963, has been promoting use of natural family planning methods and has been providing counselling services.

There is a concerted effort between the Government, MFPWA, and Action Familiale to provide family planning services. The national family planning programme has long shifted its focus from achieving demographic targets to improving the reproductive health of the population. However, since its inception, the guiding principle of the family planning programme has been that all couples and individuals have the basic right to decide freely and responsibly the number, spacing, and timing of their children.

⁴ The short-term contraceptive methods are male condom; female condom; pill; 1-month injectable; and 3-month injectable, and the long-term contraceptive methods are implant; IUD; and tubal ligation. Emergency contraceptive pills are also available.

Family Planning Clients⁵

New Acceptors

In 2020, there were 3,059 new acceptors who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Mauritius (*Table C.1*). This figure includes 477 new acceptors of tubal ligation reported at government hospitals. Three-month injectable was the most preferred method among the new acceptors accounting for 25.9%, followed by male condom (19.1%), pill (18.8%), tubal ligation (15.6%), sympto-thermal (14.4%), 1-month injectable (3.5%), IUD (1.5%), and implant (1.2%).

Current Users

As at 31st December 2020, there were 57,695 current users who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Mauritius (*Table C.11*). This figure includes 13,618 current users of tubal ligation reported at government hospitals.

FAMILY PLANNING PROGRAMME
(GOVERNMENT, MFPWA & ACTION FAMILIALE)

Sympto-thermal was the most preferred method among the current users accounting for 47.2%, followed by tubal ligation (24.6%), male condom (11.4%), pill (6.5%), 3-month injectable (5.1%), IUD (3.0%), implant (1.5%), and 1-month injectable (0.8%).

The yearly average number of current users for the five-year period has declined from 67,501 in 2011-2015 to 59,207 in 2016-2020 (*Table C.10*), resulting in a decline of 12.3%.

⁵ There are different types of family planning clients, and they include new acceptors and current users. A new acceptor is someone who accepts a contraceptive method for the first time from a provider of a family planning programme. A current user is someone who uses a method of contraception that has been obtained from the provider of the family planning programme. It should be pointed out that since the number of family planning clients of female condom in the government is small; it has been excluded in this section (In 2020: 0 new acceptors and 4 current users for Island of Mauritius).

Moreover, the programme-based statistics (for the government, MFPWA, and Action Familiale) shows that 18.9% of women aged 15-49 years and 30.4% of currently married aged 15-49 years were using a contraceptive method in 2020. However, the Contraceptive Prevalence Survey, which was carried out in 2014, showed that higher proportions of women (40.9%) aged 15-49 years and of currently married women (63.8%) aged 15-49 years were using a contraceptive method in the Island of Mauritius. This nationwide survey revealed that women in the reproductive age group 15-49 years were obtaining their contraceptive method either from programme sources (government and NGOs) or from non-programme sources (e.g. pills from pharmacies) or were using non-programme methods (such as withdrawal).

Accessibility and Attendance

Government family planning services are available through an extensive network of health service points, covering the whole island of Mauritius⁶ (*Appendix III*). Presently, there are 154 government family planning service points: 1 Community Hospital; 6 Medi-Clinics; 21 Area Health Centres; 115 Community Health Centres; 2 Family Health Clinics; 3 Family Planning Clinics; and 6 Industrial Family Supply Centres. Hence, in relation to the population size, there were about 1,987 women in the reproductive age group (15-49 years) per government family planning service point.

There has been a decline in the number of attendances at the government family planning service points from 50,412 in 2019 to 39,473 in 2020 due to Covid-19 pandemic.

In 2020, eight family planning clinics provided services after working hours, on Sundays and on public holidays.

⁶ For administrative purposes, five health regions have been established by the Ministry of Health and Wellness.

ISLAND OF RODRIGUES

VITAL STATISTICS

There were 911 live births and 292 deaths that were registered in 2020 (Table F.2). The crude birth rate was 20.8 births per 1,000 mid-year population and the crude death rate was 6.7 deaths per 1,000 mid-year population in 2020. Hence, the rate of natural increase was 14.1 in 2020.

The crude birth rate has increased from 17.7 births per 1,000 live births in 2011 to 19.1 in 2019 and in 2020, it was 20.8.

The infant mortality rate was 17.3 deaths per 1,000 live births in 2011 as well as in 2019 and in 2020, it was 17.6.

The still birth rate has increased from 8.8 still births per 1,000 total births in 2011 to 9.6 in 2019 and in 2020, it was 9.8.

The total fertility rate has declined from 3.19 children per woman in 1990 to 2.57 in 2019 and in 2020, it was 2.80 (Table F.3). In 2020, the age-specific fertility rates showed that women *aged 30-34 years* had the *highest* fertility rate (147.4) among all age groups and that women *aged 25-29 years* (132.9) had the *second* highest fertility rate (Table F.4).

FAMILY PLANNING

Family Planning Clients⁷

New Acceptors

In 2020, there were 306 new acceptors who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Rodrigues (Table F.5).

⁷ Refer to footnote 5 for types of family planning clients. It should be pointed out that since the number of family planning clients of female condom in the government is small; it has been excluded in this section (In 2020: 0 new acceptors and 0 current users for Island of Rodrigues).

3-month injectable was the most preferred method among the new acceptors, accounting for 42.8%, followed by pill (27.1%) and sympto-thermal (12.4%).

Current Users

As at 31st December 2020, there were 3,978 current users who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Rodrigues (*Table F.6*). Pill was the most preferred method among the current users accounting for 28.8%, followed by sympto-thermal (27.7%), male condom (14.8%), 3-month injectable (14.4%), implant (7.5%), tubal ligation (3.8%), and IUD (3.1%).

FAMILY PLANNING PROGRAMME
(GOVERNMENT, MFPWA & ACTION FAMILIALE)

Family Planning Service Points

In 2020, there were 15 government family planning service points in the Island of Rodrigues (*Table F.7*). Hence, in relation to the population size, there were about 758 women in the reproductive age group (15-49 years) per government family planning service point.

Attendance

In 2020, a total number of 8,751 attendances have been recorded at the government family planning service points.

Glossary

Population

Census	The total process of collecting, compiling and publishing data on the demographic, social and economic situation of all persons in a specified territory at a particular time. Decennial censuses are usually the norm.
De facto population	A population enumerated or estimated on the basis of those present at a particular time, including temporary visitors but excluding residents temporarily absent.
De jure population	A population enumerated or estimated on the basis of normal residence, excluding temporary visitors but including residents temporarily absent.
Density of population	A ratio of the number of people to the area of land that they occupy usually given as number of persons per square kilometer of area.
Natural increase	The excess of births over deaths.
Rate of natural increase	The difference between births and deaths occurring in a year per 1000 mid-year population. This rate is the difference between the 'crude birth rate' and the 'crude death rate'.
Population growth	The change in population size due to the three demographic processes, namely births, deaths, and migration.
Net external migration	The difference between international departure and arrivals of residents.

Age structure

Sex ratio	The number of males per 100 females in a population.
Total dependency ratio	The combined child population (below 15 years) and older population (aged 60 years and above) per 1,000 population of working age (i.e. 15-59 years).
Young-age dependency ratio (per 1000)	The ratio of the number of persons aged less than 15 years to the number of persons of working age (i.e. 15-59 years old).
Old-age dependency ratio (per 1000)	The ratio of the number of persons aged 60 years and above to the number of persons of working age (i.e. 15-59 years old).
Median age	The age that divides a population in two parts of equal size: i.e., there are as many persons with ages above the median age as there are with ages below the median age.
Population pyramid	A graphic that portrays the age-sex distribution of the population.

Fertility

Crude birth rate	The number of live births registered in a year per thousand estimated mid-year population.
Fertility	The childbearing performance of individuals, couples, groups or populations. It is contrasted with FECUNDITY, the theoretical capacity which may or may not lead to fertility.
General fertility rate	The number of live births occurring in a year per thousand estimated mid-year female population in their childbearing age (15-49 years).
Age-specific fertility rate	The number of live births occurring to women of a specific age group per year, normally expressed per 1,000 women in the same age group. Five-year age groups from 15-19 to 45-49 are most commonly used.
Total fertility rate	The average number of <i>children</i> that would be born to a woman assuming that she survives to the end of her childbearing age and is subjected to a fixed schedule of age-specific fertility rates.
Gross reproduction rate	The average number of <i>daughters</i> that would be born to a woman assuming that she survives to the end of her childbearing age and is subjected to a fixed schedule of <i>age-specific fertility rates</i> . This is similar to the total fertility rate except that the gross reproduction rate counts only daughters.
Net Reproduction Rate	The average number of <i>daughters</i> that would be born to a woman during her lifetime if she passed through all her childbearing years conforming to a fixed schedule of <i>age-specific fertility rates and age-specific mortality rates</i> . The net reproduction rate is closely related to gross reproduction rate employing the same data on fertility but also indicating the effects of mortality.
Replacement level fertility	The level of fertility at which a population exactly replaces itself from one generation to the next and it is taken to be an average of 2.1 children per woman. Alternatively, a net reproduction rate of 1.0 denotes replacement level fertility; the women are having just enough daughters to "replace" themselves in the population.
Mean age of Childbearing	The average age of mothers at the time of birth
Live birth order	The ordinal number of a given live birth in relation to all previous live births of the same woman.

Nuptiality

Marriage rate	The annual number of men and women marrying per thousand mid-year population
Divorce rate	The annual number of men and women divorcing per thousand mid-year population.

Mortality

Crude death rate	The number of deaths in a year per thousand estimated mid-year population.
Infant deaths	The number of deaths occurring to children less than one year of age (0-364 days).
Infant mortality rate	The number of infant deaths in a year per 1,000 live births in the same year.
Child mortality rate	The number of deaths of children aged between one year and five years (1-4 years) in a year per 1,000 mid-year population aged between one year and five years (1-4 years) in the same year.
Under five mortality rate	The number of deaths of children aged under five years (0-4 years) in a year per 1,000 live births in the same year.
Still birth	The expulsion or extraction from the mother of a dead foetus after the time at which it would normally be presumed capable of independent extra uterine existence. This is taken to be at or after 28 weeks duration of pregnancy.
Still birth rate	The number of still births in a year per 1,000 total births (live births and still births).
Early neonatal mortality rate	The number of deaths of infants under one week (0-6 days) of age in a year per 1,000 live births in the same year.
Late neonatal mortality rate	The number of deaths of infants aged between one week and four weeks (7-27 days) in a year per 1,000 live births in the same year.
Neonatal mortality rate	The number of deaths of infants aged under four weeks (0-27 days) in a year per 1,000 live births in the same year.
Post neonatal mortality rate	The number of deaths of infants aged between four weeks and one year (28-364 days) in a year per 1,000 live births in the same year.
Perinatal mortality rate	The sum of the number of deaths of children aged under 7 days and the number of still births in a year per 1,000 total births (live births and still births) in the same year.
Maternal mortality	Mortality from causes connected with pregnancy, labour or the purperium (lying-in period).
Maternal mortality ratio	Number of deaths connected with pregnancy, labour or the purperium divided by the number of live births and expressed per 1000 or 100,000.
Life expectancy at birth	The average number of years a newborn can expect to live based on the mortality conditions at the time.

Family Planning Clients & Activities

New acceptor	Someone who accepts a contraceptive method for the first time from a provider of a family planning programme.
Current User	A new acceptor who continues with the same or different method of contraception and pays regular return visits to the family planning service point to receive services and supplies.
Drop out	A current user who does not show up at scheduled appointment or thereafter within a defined period (according to the contraceptive method) for services and contraceptive resupplies at a family planning service point.
Drop out returnee	A client who starts receiving again the services and supplies available at the family planning service point after temporarily failing to pay return visits at the service point.
Canvassing	The purpose of canvassing is to seek potential clients who will benefit from information and services at a family planning service point.
Follow-Up	The purpose of follow ups is to remind clients that they have missed a scheduled appointment and to encourage them to make a return visit to the family planning service point.
Session	Field visits made by community health worker for canvassing and follow-ups.

Organisations and Acronyms

ACTION FAMILIALE (A. F.)	Action Familiale, a non-governmental organisation, was established in 1963 at the initiative of Mgr J. Margeot, then Vicar General of the Mauritian Catholic Diocese. Besides, promoting sympto-thermal, which is a modern natural family planning method, Action Familiale provides a wide range of services which includes counselling services to couples and youth.
MAURITIUS FAMILY PLANNING & WELFARE ASSOCIATION (MFPWA)	The MFPWA, a non-governmental organisation, was set up in 1957 by some volunteers who believed that the rampant population growth rate would hinder social and economic development in Mauritius. The MFPWA promotes modern methods of contraception and is involved in many family planning, women empowerment and advocacy related activities.
MATERNAL AND CHILD HEALTH/ FAMILY PLANNING (MCH/FP)	The Ministry of Health and Wellness administers the Maternal and Child Health/Family Planning Programme which promotes reproductive health. The Family Planning Programme was integrated with the Maternal and Child Health Services in 1972. Family planning services are available, free of user cost, through a network of health service points.

RIGHTS AND CHOICES ARE THE ANSWER:

WHETHER BABY BOOM OR BUST, THE SOLUTION LIES IN PRIORITIZING THE REPRODUCTIVE HEALTH AND RIGHTS OF ALL PEOPLE

The ongoing COVID-19 pandemic has exposed weaknesses in health care systems globally, and has caused serious gaps and challenges in the provision of sexual and reproductive health information and services. Additionally, the reallocation of resources away from these services is taking a toll on the health of women and girls.

At the same time, COVID-19 has exacerbated gender inequities and gender-based violence, with increased incidence of violence under lockdowns. There are also signs that child marriage and female genital mutilation are increasing, and failing to be mitigated, as programmes to address these harmful practices have been interrupted.

Compounded economic impacts of the pandemic have been felt especially by women and girls, who generally earn less, hold less secure jobs, and face greater risk of losing their livelihoods or descending into poverty. Women have also faced an increased burden of unpaid care work, pushing many out of the workforce entirely.

Against this backdrop, many people express growing concern over changing fertility rates, which in some places seem to be accelerating due to the pandemic. Historically, alarmism over low fertility rates shifts the responsibility on women, at least implicitly, without taking into account broader social and economic challenges that make it difficult for people to have the number of children they want. In some cases it has led to retrogressive measures such as reducing access to legal abortion, and/or restrictions on contraception. In places with rising populations, harmful policy responses to reduce fertility rates have included coercive family planning and sterilization.
