

REPUBLIC OF MAURITIUS

FAMILY PLANNING & DEMOGRAPHIC YEARBOOK 2015

VOLUME 41 OCTOBER 2016

AGE STRUCTURE OF THE POPULATION

DEMOGRAPHIC/EVALUATION UNIT MINISTRY OF HEALTH AND QUALITY OF LIFE Mauritius is currently cited as having one of the best sexual and reproductive health programme including family planning in Africa. Since its inception in the early 60s, the family planning programme has allowed women to have control on both their productive and reproductive lives. Women have been able to bridge the gap between planned and unplanned pregnancies through the accessibility and use of contraceptives, which have allowed them to have the desired number of children. This has empowered them in all spheres of society- in home and community, in health and educational, in the workplace and in political participation and leadership. Thus they have been able to contribute tremendously to the socio-economic development of the country.

The family planning programme has shifted its focus from achieving demographic targets to improving the reproductive health of the population, which is in line with goal three of the Sustainable Development Goals (SDGs) adopted by the United Nations in September 2015. The Government of Mauritius provides comprehensive sexual and reproductive health services to its population, free of user cost, through a network of about 150 health service points.

The Demographic/Evaluation Unit of the Ministry of Health and Quality of Life, which is responsible for monitoring and evaluating the national family planning programme, publishes the Family Planning and Demographic Yearbook. The present issue of this yearbook is the forty-first volume and presents data on population trends, vital rates, family planning, and health service points for both Island of Mauritius and Island of Rodrigues.

The family planning and demographic data presented in this yearbook has been obtained from different Departments of this Ministry, namely the Medi clinics, Area/Community Health Centres, the Health Statistics Section, the Medical Records Division and from Statistics Mauritius of the Ministry of Finance and Economic Development.

Data from the Mauritius Family Planning and Welfare Association and Action Familiale, which are two non-governmental organizations that provide family planning services, are also included in this yearbook.

This Family Planning and Demographic Yearbook is intended for planners, policy makers and the general public.

In presenting this yearbook, I would like to thank my staff and other organizations involved directly or indirectly to its compilation.

J. Sunkur Chief Demographer October 2016

Demographic/Evaluation Unit Ministry of Health and Quality of Life

Analysis of Demographic

മ്

Reproductive Health Indicators

This 2015 Yearbook is the forty-first volume presenting demographic and family planning data for Island of Mauritius and for Island of Rodrigues. The 65 tables and 24 charts are grouped under the following headings: *population, vital statistics, family planning and health service points.*

Island of Mauritius

Age structure of the population

Table A.1 shows the population distribution of the Island of Mauritius at census dates. The average annual population growth rate was 0.42% during the intercensal period of 2000-2011: The censuses enumerated 1,196,383 inhabitants in 2011 compared to 1,143,069 inhabitants in 2000. In 2011, the sex ratio was 976 males per 1000 females.

Table A.2 shows the estimated mid-year resident population according to age group and sex in 2014 and 2015. The figures show that between 2014 and 2015 the proportion of population aged under 15 has decreased slightly from 20.0% to 19.4% and the proportion of the elderly population (aged 60 and above) has increased from 14.4% to 14.8%. Moreover, the median age of the population, the age at which 50% of the population is older and 50% is younger than that age, has increased from 34.9 years in 2014 to 35.5 years in 2015. Tables A.8 to A.11 summarise the changes in the age structure of the Mauritian population from 1962 to 2055. The total size of the medium variant projected population is estimated to decline by 22.4% between 2015 and 2055. The proportion of people aged under 15 will decline from 19.3% in 2015 to 10.8% in 2055 and the proportion of people aged 60 and above will increase from 14.9% in 2015 to 35.1% in 2055. In absolute numbers, the elderly population will increase from 181,699 in 2015 to 332,445 in 2055, thus exhibiting an increase of slightly less than twofold.

Mauritius is experiencing ageing of its population. There is also a progressive ageing of the older population itself. Chart 6 shows that in 2015, the oldest old, persons aged 80 years or older, represented 11.9% of the elderly population *(60 years and above)*. It is projected that by 2045, the oldest old will represent 17.9% of the elderly population, which implies that there will be an increasingly demand for healthcare services with the growing ageing population.

Chart 4 portrays the age-sex profiles of the population of Island of Mauritius. In 1962, there were larger percentages of the population in the younger age group as shown by the expansive population pyramid compared with the one in 2015. In 2055, the population pyramid shows larger percentages of the population in the older age group. Table A.9 shows that the median age of the population is projected to increase from 35.5 years in 2015 to 51.1 years in 2055.

Life expectancy at birth has improved considerably over the years. Table B.8 shows that life expectancy at birth was 77.77 years for females and 71.00 years for males in 2014. During the period 2050-2055, life expectancy at birth is projected to be 79.52 years for females and 75.50 years for males (Table A.7).

Table B.1 indicates that the population growth rate in 2015 was 0.07% and if this annual rate is maintained, it will take about 1000 years for the 2015 population to double in size.

Vital Rates

The last three decades has been characterised by a cyclical trend in the crude birth rate: a steady decline from 22.1 in 1982 to 18.3 in 1986 and after an increase from 19.1 in 1987 to 21.1 in 1992, the crude birth rate decreased steadily to 9.9 in 2015. Moreover, the average crude birth rate in the last 5-year period has declined compared with the preceding 5-year period, from 12.9 for the period of 2006-2010 to 10.8 for the period of 2011-15.

The crude death rate was 7.8 in 2015. In fact, the crude death rate has fluctuated between 6.5 and 7.8 during the last 30 years, i.e 1985-2015.

There have been significant improvements in the survival of infants over the past three decades. The infant mortality rate has decreased from 23.8 in 1985 to 13.7 in 2015 showing a decrease of 42.4%. Moreover, the average infant mortality rate in the last 5-year period has declined compared to the preceding 5-year period from 13.8 for the period of 2006-2010 to 13.2 for the period 2011-2015.

The under-five mortality rate is a leading indicator of child health and overall human development and it is indicative of government commitment to health. Figures show that the under-five mortality rate has decreased from 29.5 in 1985 to 15.5 in 2015 showing a decrease of 47.5%.

Table B.3 shows that the still birth rate has dropped from 19.5 in 1985 to 9.7 in 2015 showing a decrease of 50.3%.

The maternal mortality rate dropped from 1.0 maternal death per 1000 live births in 1985 to 0.33 (33 maternal deaths per 100,000 live births) in 2015 showing a decrease of 67.0%.

The perinatal mortality rate has declined from 33.6 in 1985 to 16.1 in 2015 representing a decrease of 52.1%.

The early neonatal mortality rate dropped from 14.4 in 1985 to 6.5 in 2015, thus indicating a decrease of 54.9%. It should be noted that early neonatal deaths contributed to about 47% of all infant deaths in 2015.

Vital rates by geographical distribution

Tables B.4 to B.7 show the trends in vital rates by district in 1972, 1983, 1990, 2000 and from 2008 to 2015. Port Louis had the highest crude birth rate (13.3) in 2015, while Flacq had the lowest crude birth rate (8.1). Overall, three districts had higher crude birth rates than the national level of 9.9.

In 2015, Port Louis had the highest crude death rate (10.2) and Black River had the lowest crude death rate (5.3). Overall, three districts had higher crude death rates than the national level of 7.8.

In 2015, Port Louis had the highest still birth rate (14.9) and Moka had the lowest still birth rate (5.2). Overall, five districts had higher still birth rates than the national level of 9.7.

In 2015, Moka had the highest infant mortality rate (18.3) and Black River had the lowest infant mortality rate (5.9). Overall, four districts had higher infant mortality rates than the national level of 13.7.

Fertility Rates

Tables B.9 to B.12 show the trends in fertility rates. There has been a downward shift in the general fertility rate from 181.4 in 1962 to 59.44 in 2000 and a further decrease to reach 38.36 in 2015.

The total fertility rate decreased from 5.86 in 1962 to 1.94 in 1986, but increased to 1.97 in 2000. Thereafter, the total fertility rate showed a significant decrease to reach 1.34 in 2015. Island of Mauritius continues to experience below replacement fertility level (replacement level equals to 2.1 children per woman).

The net reproduction rate decreased from 2.51 in 1962 to 0.90 in 1986 but increased to 0.93 in 2000. In 2015, the net reproduction rate was 0.63.

Table B.9A shows that between 2008 to 2015, the fertility rates declined in most of the five-year age groups except in the age group 35-39 years. In 2015, the age-specific fertility rates showed that women aged 25-29 had the highest fertility rate (84.5) followed by women aged 30-34 (65.2). It is noted that between 2014 and 2015, there has been a slight increase in fertility among women aged 40-44 years.

Adolescent fertility rate (age group 15-19) decreased from 34.2 in 2008 to 22.5 in 2015, thus showing a decrease of 34.2%. In 2015, there were 27 live births pertaining to mothers aged under 15 years.

In 2015, there were 2,143 births of third and higher orders, which accounted for 17.9% of the 11,968 total live births occurred in the Island of Mauritius. Table B.11 shows that 8.7% of the total live births were to mothers aged under 20 years, thus representing 1,041 live births of which 20 were of third and higher orders.

The censuses reveal that the mean age of childbearing has increased from 26.3 years in 1983 to 26.9 years in 2000 and to 27.5 in 2011.

Nuptiality

Postponement of marriage has played a crucial role in fertility reduction in Mauritius as revealed by censuses data. Table A.4 shows that the proportion of currently

married women in the age group 15-19 has declined from 27.80% in 1962 to 10.50% in 1983 and 6.24% in 2011.

Chart 14 shows a downward trend in the marriage rate from 19.2 in 1995 to 15.6 in 2015. In 2015, 9,548 marriages were registered in the Island of Mauritius.

The 2011 census figures show that the singulate mean age at marriage was 29.0 years for males and 23.9 years for females.

In 2015, 2,161 divorces were granted in the Republic of Mauritius compared with 2,262 in 2014 and 66.6% of all couples granted divorce in 2015 had at least one dependent child. Chart 15 shows that the divorce rate was 3.4 in 2015 for the Republic of Mauritius.

Family Planning

New Acceptors

In 2015, there were a total of 4,570 new acceptors in the Island of Mauritius at Government Family Planning Clinics, Mauritius Family Planning & Welfare Association (MFPWA) and Action Familiale (A.F.). This total also includes 471 new acceptors of tubal ligation reported at Government hospitals. Sympto-thermal was the most preferred method among new acceptors accounting for 25.3% followed by pill (22.6%), male condom (18.9%), 3-month injectable (17.5%), tubal ligation (10.3%), monthly injectable (2.8%), intra-uterine device (1.9%) and implant (0.6%).

Current Users

Table C.11 shows that there were a total of 64,270 current users as at 31st December 2015 in the Island of Mauritius at Government Family Planning Clinics, A.F. and MFPWA. This total also includes the 13,307 clients who have undergone tubal ligation, but were registered at Government hospitals. Among the total current users,

43.17% were on sympto-thermal, 22.54% were on tubal ligation, 12.20% were on male condom, 10.97% were on pill, 5.05% were on 3-month injectable, 3.43% were on intra-uterine device, 1.79% were on implant and 0.85% on monthly injectable.

The service statistics of Government and NGOs show that 20.6% of women in the reproductive age group and 29.4% of ever married women in the reproductive age group were contraceptive users in 2015. However at national level, as revealed by the results of the 2014 contraceptive prevalence survey, 63.8% of currently married women in the reproductive age group used family planning methods. This nationwide survey revealed that besides from government clinics, Action Familiale and MFPWA, women obtained their contraceptive supplies from private clinics and pharmacies and others used traditional methods.

Family Planning Service Points

The Ministry of Health and Quality of Life has established 5 operational health regions covering the whole Island of Mauritius and within each health region, there are service points that provide family planning services and information. Presently, there are 163 service points throughout Island of Mauritius: 1 Community Hospital, 5 Medi-Clinics, 20 Area Health Centres, 117 Community Health Centres, 2 Family Health Clinics, 3 Family Planning Clinics and 15 Industrial Family Planning Supply Centres. Moreover, about 1,914 women in the reproductive age group are served per point.

Table E.3 shows that there was an attendance of 68,669 family planning clients at the service points for the Island of Mauritius in 2015.

In 2015, 9 family planning clinics provided services after working hours, on Sundays and on public holidays.

Island of Rodrigues

Tables F.1 to F.6 show the vital rates and family planning statistics in Rodrigues. In the past three decades, the crude birth rate dropped significantly from 28.5 in 1985 to 16.2 in 2015.

Fertility levels in Rodrigues, also measured by the total fertility rate, have declined from 5.16 in 1983 to 2.08 in 2015.

In 2015, women in the age group 25-29 had the highest fertility rate (105.7) followed by women aged 20-24 years (84.7). The adolescent fertility rate (age group 15-19) was 52.6 which is the lowest figure ever recorded in Rodrigues.

Rodrigues has witnessed remarkable improvement in the survival of infants. The infant mortality rate dropped from 51.9 in 1985 to 11.7 in 2015.

The still birth rate dropped from 18.2 in 1985 to 10.2 in 2015, thus representing a decrease of 44.0%.

In 2015, 311 new acceptors were recorded in the Government Family Planning Clinics , Mauritius Family Planning & Welfare Association (MFPWA) and Action Familiale (A.F.) in Rodrigues: 107 were on 3-month injectable, 92 were on pill, 41 were on implant, 40 were on sympto-thermal, 19 were on male condom, 8 were on intrauterine device and 4 were on tubal ligation.

Moreover, at 31st of December 2015, 5,109 current users were recorded: 37.8% were on pill, 23.1% were on sympto-thermal, 15.0% were on 3-month injectable, 10.7% were on male condom, 7.2% on implant, 3.6% were on tubal ligation and 2.6% were on intra-uterine device.

The service statistics of Government and NGOs show that 46.8% of women in the reproductive age group were contraceptive users in 2015.

Family Planning Service Points

In 2015, there were 17 family planning service points in the Island of Rodrigues and about 642 females in the reproductive age group were served per point.

Island of Mauritius, Year 2015

Population Data

Estimated mid-year population	1,220,663
Population density (inhabitants per square km)	653
Sex ratio (males per 1,000 females)	980
Population growth rate (%)	0.07
% of mid-year population aged under 15 years	19.3
% of mid-year population aged 60 year & over	14.9
% of mid-year population aged 65 year & over	9.4
% of female population aged 15-49 years over total population	25.6

Fertility

Crude birth rate (per 1,000 mid-year population)	9.9
Total fertility rate	1.34
Gross reproduction rate	0.64
Net reproduction rate	0.63

Mortality

Crude death rate (per 1,000 mid-year population)	7.8
Infant Mortality rate (per 1,000 live births)	13.7
Maternal mortality ratio (per 1,000 live births)	0.33
Life expectancy at birth (years) 2013-2015:	
Female	77.77
Male	71.00

Family Planning (Government Services and NGOs)

Number of new acceptors	4,570
New acceptors as a % of female population aged 15-49 years	1.5
Number of current users	64,270
Current users as a % of female population aged 15-49 years	20.6

SELECTED DEMOGRAPHIC INDICATORS OF MAURITIUS AS COMPARED TO WORLD, REGIONS AND OTHER SELECTED COUNTRIES - 2015

Note: Medium variant projection - base year 2015

 $^{\Box}$ The ratio of the population below age 15 to that aged 15-64.

[#] The ratio of the population aged 65 & above to that aged 15-64.

* The ratio of the combined population below age 15 and population aged 65 & above to the population of intermediate aged 15-64.

٥ Number of persons of working age (15-64 years) for each old person (aged 65 years and over).

• Number of persons aged 65 & above per 100 children below age 15.

[@] RATES ARE PER 1,000

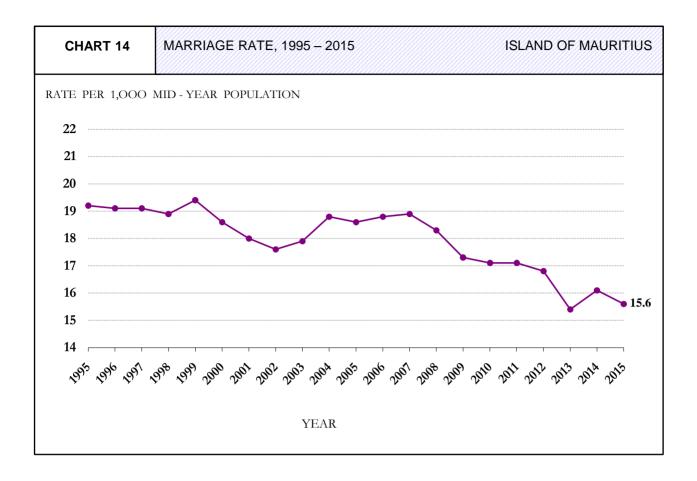

CENSUS YEARS

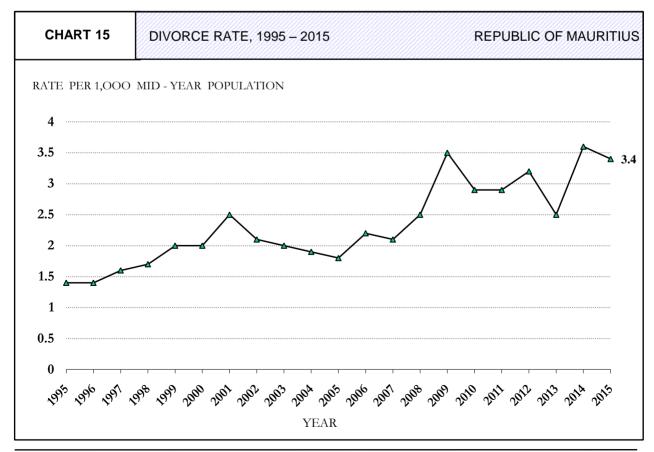

Notes: 1. POPULATION FIGURES FOR 1983 AND EARLIER YEARS REFER TO "DE FACTO" POPULATION 2. POPULATION FIGURES FOR 1984 AND LATER YEARS REFER TO "DE JURE" POPULATION

*This rate is the difference between the crude birth rate and the crude death rate

Family Planning and Demographic Yearbook 2015, Ministry of Health and Quality of Life [22]

SOURCE: STATISTICS MAURITIUS

[#] Rates are per 1,000.

Note: In calculating the rates, live births occurring to mothers less than 15 years have been included in the age group (15-19) whilst those occurring to mothers aged 50 years and above in the age group (45 - 49). Births for age "Not stated" and birth order "Not stated" have been prorated.

Glossary

Population

Census	The total process of collecting, compiling and publishing data on the demographic, social and economic situation of all persons in a specified territory at a particular time. Decennial censuses are usually the norm.
De facto population	A population enumerated or estimated on the basis of those present at a particular time, including temporary visitors but excluding residents temporarily absent.
De jure population	A population enumerated or estimated on the basis of normal residence, excluding temporary visitors but including residents temporarily absent.
Density of population	A ratio of the number of people to the area of land that they occupy usually given as number of persons per square kilometer of area.
Natural increase	The excess of births over deaths.
Rate of natural increase	The difference between births and deaths occurring in a year per 1000 mid-year population. This rate is the difference between the 'crude birth rate' and the 'crude death rate'.
Population growth	The change in population size due to the three demographic processes, namely, births, deaths, and migration.
Doubling time	The number of years it would take for the population to double its current size at the current annual rate of growth.
Net external migration	The difference between international departure and arrivals of residents.
Age structure	

Sex ratio	The number of males per 100 females in a population.
Total dependency ratio	The combined child population (below 15 years) and older population (aged 60 years and above) per 1,000 population of the intermediate age (15-59 years).
Young-age dependency ratio (per 1000)	The ratio of the population below aged 15 years to that aged 15-59 years.
Old-age dependency ratio (per 1000)	The ratio of the population aged 60 years and above to that aged 15-59 years.
Median age	The age that divides a population into numerically two equal groups; one which is younger and the other which is older.
Population pyramid	A graphic that portrays the age-sex distribution of the population.

Fertility

Crude birth rate	The number of live births registered in a year per thousand estimated mid-year population.
Fertility	The childbearing performance of individuals, couples, groups or populations. It is contrasted with FECUNDITY, the theoretical capacity which may or may not lead to fertility.
General fertility rate	The number of live births occurring in a year per thousand estimated mid-year female population in their childbearing age (15-49 years).
Age-specific fertility rate	The number of live births occurring to women of a particular age or age group per year, normally expressed per 1,000 women. Five-year age groups from 15-19 to 45-49 are most commonly used.
Total fertility rate	The average number of <i>children</i> born to a woman assuming that she survives to the end of her childbearing age and is subjected to a fixed schedule of age-specific fertility rates.
Gross reproduction rate	The average number of <i>daughters</i> born to a woman assuming that she survives to the end of her childbearing age and is subjected to a fixed schedule of <i>age-specific fertility rates</i> . This is similar to the total fertility rate except that the gross reproduction rate counts only daughters.
Net Reproduction Rate	The average number of <i>daughters</i> that would be born to a woman during her lifetime if she passed through all her childbearing years conforming to a fixed schedule of <i>age-specific fertility rates and age-specific mortality</i> <i>rates.</i> The net reproduction rate is closely related to gross reproduction rate employing the same data on fertility but also indicating the effects of mortality.
Replacement level fertility	A net reproduction rate of 1.0 denotes replacement level fertility; the women are having just enough daughters to "replace" themselves in the population.
Mean age of Childbearing	The average age of mothers at the time of birth
Live birth order	The ordinal number of a given live birth in relation to all previous live births of the same woman.
Nuptiality	
Marriage rate	The annual number of men and women marrying per thousand mid-year population
Divorce rate	The annual number of men and women divorcing per thousand mid-year population.

Mortality

Crude death rate	The number of deaths in a year per 1,000 mid-year population.
Infant deaths	The number of deaths occurring to children less than one year of age (0 - 364 days).
Infant mortality rate	The number of infant deaths in a year per 1,000 live births in the same year.
Child mortality rate	The number of deaths of children aged between one year and five years (1-4 years) in a year per 1,000 mid-year population aged between one year and five years (1-4 years) in the same year.
Under five mortality rate	The number of deaths of children aged under five years (0-4 years) in a year per 1,000 live births in the same year.
Still birth	The expulsion or extraction from the mother of a dead foetus after the time at which it would normally be presumed capable of independent extra uterine existence. This is taken to be after 28 weeks duration of pregnancy.
Still birth rate	The number of still births in a year per 1,000 total births (live births and still births).
Early neonatal mortality rate	The number of deaths of infants under one week (0-6 days) of age in a year per 1,000 live births in the same year.
Late neonatal mortality rate	The number of deaths of infants aged between one week and four weeks (7-27 days) in a year per 1,000 live births in the same year.
Neonatal mortality rate	The number of deaths of infants aged under four weeks (0-27 days) in a year per 1,000 live births in the same year.
Post neonatal mortality rate	The number of deaths of infants aged between four weeks and one year (28-364 days) in a year per 1,000 live births in the same year.
Perinatal mortality rate	The sum of the number of deaths of children aged under 7 days and the number of still births in a year per 1,000 total births (live births and still births) in the same year.
Maternal mortality	Mortality from causes connected with pregnancy, labour or the purperium (lying-in period).
Maternal mortality ratio	Number of deaths connected with pregnancy, labour or the purperium divided by the number of live births and expressed per 1000 or 100,000.
Life expectancy at birth	The average number of years a newborn can expect to live based on the mortality conditions at the time.

Family Planning Clients & Activities

New acceptor	Someone who accepts a contraceptive method for the first time from a provider of a family planning programme.
Current User	A new acceptor who continues with the same or different method of contraception and pays regular return visits to the family planning service point to receive services and supplies.
Drop out	A current user who does not show up at scheduled appointment or thereafter within a defined period (according to the contraceptive method) for services and contraceptive resupplies at a family planning service point.
Drop out returnee	A client who starts receiving again the services and supplies available at the family planning service point after temporarily failing to pay return visits at the service point.
Canvassing	The purpose of canvassing is to seek potential clients who will benefit from information and services at a family planning service point.
Follow-Up	The purpose of follow ups is to remind clients that they have missed a scheduled appointment and to encourage them to make a return visit to the family planning service point.
Session	Field visits made by community health worker for canvassing and follow-ups.

Organisations and Acronyms

ACTION FAMILIALE (A. F.)	Action Familiale, a non-governmental organisation, was established in 1963 at the initiative of Msgr J. Margeot, then Vicar General of the Mauritian Catholic Diocese. Besides, promoting sympto-thermal, which is a natural family planning method, Action Familiale provides a wide range of services which includes counselling services to couples.
MAURITIUS FAMILY PLANNING & WELFARE ASSOCIATION (MFPWA)	The MFPWA, a non-governmental organisation, was set up in 1957 by some volunteers who believed that the rampant population growth rate would hinder economic development in Mauritius. The MFPWA promotes modern methods of contraception and is involved in many family planning related activities.
Maternal and Child Health/ Family Planning (MCH/FP)	The Ministry of Health and Quality of Life administers the Maternal and Child Health/Family Planning Programme which promotes reproductive health. The Family Planning Programme was integrated with the Maternal and Child Health Services in 1972.

World Population Day 2016: Investing in teenage girls

Teenage girls around the world face more and greater challenges than their male counterparts. In many countries, a girl who reaches puberty is deemed by her family and community as ready for marriage, pregnancy and childbirth. She may be married off and forced to leave school. She may suffer a debilitating condition from delivering a child before her body is ready for it. She may be denied her human rights. Every teenage girl has the right to a safe and successful transition into adulthood and the right to embrace the opportunities that the future holds for them. UNFPA, United Nations Population Fund, is committed to promoting and protecting these rights and to supporting teenage girls to determine their own destinies. The new 2030 Agenda for Sustainable Development is an unprecedented opportunity for teenage girls to claim their rights, realize their aspirations and transform our world. When countries invest in the health and education of their youth, especially teenage girls, and create opportunities for them to realize their full potential, they are also better positioned to realize a demographic dividend, which can propel economic growth to combat poverty.
