

**REPUBLIC OF MAURITIUS** 

# FAMILY PLANNING & DEMOGRAPHIC YEARBOOK 2016

VOLUME 42 OCTOBER 2017

## DEMOGRAPHIC/EVALUATION UNIT MINISTRY OF HEALTH AND QUALITY OF LIFE

Since independence, Mauritius being a welfare state has sustained the provision of health services to all citizens, free of user cost. Health facilities are relatively well distributed all over the country to provide adequate access to primary, secondary and tertiary care services. These services include sexual and reproductive health including family planning.

The Demographic/Evaluation Unit of the Ministry of Health and Quality of Life, which is responsible for monitoring and evaluating the national family planning programme, publishes the Family Planning and Demographic Yearbook. The present issue of this yearbook is the forty-second volume and presents data on population trends, vital rates, family planning, and health service points for both Island of Mauritius and Island of Rodrigues.

The family planning and demographic data presented in this yearbook has been obtained from different Departments of this Ministry, namely the Medi clinics, Area/Community Health Centres, the Health Statistics Section, the Medical Records Division and from Statistics Mauritius of the Ministry of Finance and Economic Development.

Data from the Mauritius Family Planning and Welfare Association and Action Familiale, which are two non-governmental organizations that provide family planning services, are also included in this yearbook.

This Family Planning and Demographic Yearbook is intended for planners, policy makers and the general public.

We wish to express our thanks to all parties who have been in assistance to the compilation of this report.

J. Sunkur Chief Demographer October 2017

TABLE OF CONTENTS	III - VI
A SUMMARY ON THE DEMOGRAPHIC & FAMILY PLANNING STATISTICS	VII – XIX
SELECTED DEMOGRAPHIC & REPRODUCTIVE HEALTH INDICATORS – ISLAND OF MAURITIUS	XXI - XXIII

#### **ISLAND OF MAURITIUS**

TABLE		
	POPULATION	
A.1	Population at census dates by sex, sex ratio, population density and the annual intercensal growth rate, 1846-2011	1
A.2	Population enumerated at census dates by marital status and sex, 2000 and 2011	3
A.3	Proportion of currently and ever-married female population at census dates	4
A.4	Estimated mid-year resident population by age group and sex, 2015 and 2016	5
A.5	End of year estimated resident population by district & sex , 2014-2016 – <i>Republic</i> of Mauritius	7
A.6	Population growth and vital statistics, 1988-2016	8
A.7	Life expectancy by age and sex, selected years	9
A.8	Projection of the resident population by sex, 2016-2036	10
A.9	Projection of the resident population by sex, 2041-2056	11
A.10	Distribution of the resident population at census years by selected age group, age indicators, dependency ratios (based on age 60 and over), and ageing index, selected years, 1962-2011	13
A.11	Distribution of the resident mid-year population by selected age group, age indicators, dependency ratios (based on age 60 and over), and ageing index, selected years, 2016-2056	14
A.12	Distribution of the resident population at census years by selected age group, age indicators, dependency ratios (based on age 65 and over), and ageing index, selected years, 1962-2011	16
A.13	Distribution of the resident mid-year population by selected age group, age indicators, dependency ratios (based on age 65 and over), and ageing index, selected years, 2016-2056	17
	VITAL STATISTICS	
B.1	Population and vital statistics rates, 1936-2016	21
B.2	Still births, perinatal, neonatal, infant and maternal deaths, 1982-2016	23
B.3	Crude birth rate by district, 1972, 1983, 1990, 2000, 2007-2016	25
B.4	Crude death rate by district, 1972, 1983, 1990, 2000, 2007-2016	25
B.5	Still birth rate by district , 1972, 1983, 1990, 2000, 2007-2016	26
B.6	Infant mortality rate by district, 1972, 1983, 1990, 2000, 2007-2016	26
B.7	Fertility rates, 1962, 1972, 1986, 2000, 2007-2016	27

#### **TABLE OF CONTENTS**

B.8	Age-specific fertility rates by age of mother: 1962, 1972, 1983, 2000, 2007-2016	27
B.9	Age-specific fertility rates by age of mother and live birth order, 2015 & 2016	29
B.10	Live births occurred by age of mother and live birth order, 2015 & 2016	30
B.11	Trend in fertility rates by live birth order, 2007-2016	31
B.12	Projected demographic rates (medium variant), 2016-2056	32

25	Number of current users of contraceptive methods at primary health care centres by district (Government only) 2015-2016 - <i>Island of Mauritius</i>	95

## A SUMMARY ON THE DEMOGRAPHIC AND FAMILY PLANNING STATISTICS

A summary of the statistics presented in the 2016 Family Planning and Demographic Yearbook is given in this section. The 2016 Yearbook is the forty-second volume and provides statistics for Island of Mauritius and Island of Rodrigues on demography as well as on family planning for the government and the two non-governmental organisations, namely Mauritius Family Planning and Welfare Association and Action Familiale. The tables and charts in this volume have been grouped under the following headings: population, vital statistics, and family planning.

## **ISLAND OF MAURITIUS**

#### **CENSUS**

The last two censuses have been carried out in 2000 and 2011, and the *de jure*<sup>1</sup> counts revealed that there were 1,143,069 inhabitants and 1,196,383 inhabitants respectively, and that the population density has increased from 613 inhabitants per square kilometre in 2000 to 642 in 2011 (*Table A.1*). Moreover, it is noted that the average annual population growth rate of 0.42% for the period 2000-2011 was lower than the annual growth rate of 1.12% for the earlier intercensal period 1990-2000.

## **POPULATION SIZE, GROWTH AND DISTRIBUTION**

The estimated resident population was 1,221,213 as at 1st July 2016, thus showing an increase of 550 persons since 1st July 2015 (*Table A.4*). Moreover, the estimated mid-year population in 2016 shows that there were more females than males: 616,769 females and 604,444 males.

<sup>&</sup>lt;sup>1</sup> A population enumerated on the basis of normal residence, excluding temporary visitors but including residents temporarily absent.

Family Planning And Demographic Yearbook 2016, Ministry Of Health And Quality Of Life

The population growth rate was 0.05% in 2016 and if this rate is maintained, it will take more than 1,000 years for the population to double in size (*Table A.6*).

In 2016, an estimate of 42.3% of the population lived in urban areas and 57.7% lived in rural areas.

#### **SEX RATIO**

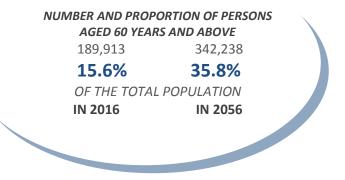

The sex ratio is a measure used to describe the balance between males and females in a population. In 2016, the sex ratio at birth was 106.1 males per 100 females (more boys were born than girls), and the sex ratio of the total population was 98.0 males per 100 females.

Due to the 'female survival advantage' in life expectancy, there are more females in the older age groups than in the younger age groups, and the gap increases with age. For instance, in 2016, there were 79.4 men per 100 women in the age group 60 and above and 52.7 men per 100 women in the age group 80 and above (*Chart 3*).

#### **CHANGING AGE STRUCTURE**

The population of Mauritius is ageing due to sustained low fertility level, resulting in a lower proportion of children in the population, and increasing life expectancy, resulting in a higher proportion of elders in the population. Hence, as the population is growing older, Mauritius is witnessing a change in its age structure.

The proportion of the population aged 60 years and above has increased from 9.1% of the total mid-year population in 2000 to 15.6% in 2016, and it is projected<sup>2</sup> to increase to 26.9% in 2036 and 35.8% in 2056 (*Chart 6*).

<sup>&</sup>lt;sup>2</sup> Medium variant projection based on 2016 population.

Conversely, the proportion of people aged 0-14 years has decreased from 25.0% of the total mid-year population in 2000 to 18.7% in 2016, and it is projected to decrease to 13.7% in 2036 and 10.9% in 2056. The proportion of the population aged 15-59 years has remained almost constant (65.8% of the total mid-year population in 2000 and 65.7% in 2016), and it is projected to decrease to 59.4% in 2036 and 53.3% in 2056.

Changes in the age structure are also reflected in the median age of the population; 50% of the population is older than this age and 50% is younger. The median age of the population has increased from 29.2 years in 2000 to 35.9 years in 2016, and it is projected to increase to 44.3 years in 2036 and 51.5 years in 2056.

Mauritius is also witnessing a progressive ageing of its older population itself. In 2016, persons aged 80 years or older comprised 11.7% of the elderly population (60 years and above), and it is projected that by 2056, they will comprise 19.9% of the elderly population (*Chart 7*). In other words, about 1 in 9 persons aged 60 years or older was 80 or above in 2016, and by 2056 this ratio is projected to increase to approximately 1 in 5.

Population pyramids are useful in examining the age-sex structure of a population. The juxtaposed population pyramids for year 2016 and 2056 show that, due to the projected rise in the number and proportion of old people in the population, the apex of the 2056 pyramid is broader than that of the 2016 pyramid (*Chart 11*). Moreover, based on the projected changes in the age structure, there will be an increasingly demand for healthcare services for the elderly.

Another ramification of the changes in the age distribution is that the total dependency ratio will continue to increase: The share of the economically active population will decrease whilst the share of dependents will increase. The total dependency ratio compares the number of dependents (aged *0-14 years* and *60 years and above*) to the number of persons of working age (aged *15-59 years*); a higher ratio indicates a higher burden on the working population. The total dependency ratio has increased from 519.2 in 2000 to 521.7 in 2016, and it is projected to increase to 683.8 in 2036 and 876.9 in 2056 (*Table A.11*).

## WOMEN IN THE REPRODUCTIVE AGE GROUP (15-49 YEARS)

The number and proportion of women in the reproductive age group (15-49 years) are important demographic factors to consider in a reproductive health (including family planning) programme. The proportion of the women in the reproductive age group (15-49 years) has decreased from 56.3% of the total mid-year female population in 2000 to 50.3% in 2016, and it is projected to decrease to 42.7% in 2036 and 34.8% in 2056 (*Chart 8*).

#### LIFE EXPECTANCY

Life expectancy at birth has improved considerably and is expected to improve further over the years: It increased from 69.3 years in 1989-1991 to 74.4 years in 2014-2016 (*Table A.7*). Likewise, female life expectancy at birth increased from 73.4 years in 1989-1991 to 77.8 years in 2014-2016 and male life expectancy at birth increased from 65.6 years in 1989-1991 to 71.1 years in 2014-2016.

Life expectancy at birth is higher for females than for males but the gap between male and female life expectancy at birth is narrowing. The above-mentioned figures show that a girl born in 1989-1991 could expect to live 7.8 years longer than a boy born in the same period, and for a girl born in 2014-2016, she could expect to live 6.7 years longer.

Life expectancy at age 60 for the total population was 20.4 years in 2014-2016, and women aged 60 years in 2014-2016 could expect to live an additional 22.2 years, compared with 18.4 years for men aged 60 years in the same period.

## **VITAL STATISTICS**

There were 12,330 live births and 9,920 deaths that were registered in 2016, resulting in a natural increase of 2,410 (live births minus deaths). Moreover, in 2016, there were 273 more live births and 424 more deaths than in 2015 (*Table B.1*).

The crude birth rate has declined from 13.5 births per 1,000 mid-year population in 2007 to 10.1 in 2016, and the crude death rate has increased from 6.9 deaths per 1,000

mid-year population in 2007 to 8.1 in 2016. Hence, the rate of natural increase was 6.6 in 2007 and 2.0 in 2016. Moreover it is noted that the average crude birth rate for the five-year period has declined, from 12.4 in 2007-2011 to 10.5 in 2012-2016. As for the crude death rate, it has fluctuated between 6.9 and 8.1 during the period of 2007-2016.

The infant mortality rate is often used as a proxy measure of the overall health of the population. There were 143 infant deaths (deaths under 1 year) that were registered in 2016, resulting to 22 fewer infant deaths than in 2015. The infant mortality rate has declined from 15.3 deaths per 1,000 live births in 2007 to 11.6 in 2016, resulting in a drop of 24.2%. Moreover, it is noted that the average infant mortality rate for the five-year period has declined, from 13.6 in 2007-2011 to 13.0 in 2012-2016.

During the period of 2007-2016, the early neonatal mortality rate has fluctuated between 4.9 and 8.2 deaths per 1,000 live births; the lowest ever-recorded rate was in 2016. Early neonatal deaths (deaths under 7 days) accounted for 42.0% of all infant deaths in 2016.

The number of still births was 117 in 2016, which was slightly lower than in 2015 (118). The still birth rate has fluctuated between 6.6 and 10.1 during the period of 2007-2016; the lowest rate ever-recorded was in 2010. In 2016, the still birth rate was 9.4 still births per 1,000 total births.

The under-five mortality rate is a leading indicator of child health and overall human development. The under-five mortality rate (deaths under five years) has declined from 17.2 deaths per 1,000 live births in 2007 to the lowest ever-recorded rate of 13.2 in 2016, resulting in a decrease of 23.3%. Moreover, the data shows that the average under-five year mortality rate for the five-year period has declined, from 16.0 in 2007-2011 to 14.8 in 2012-2016.

There has been a marked improvement in maternal health especially in the second half of the twentieth century (*Table B.2*). For instance, the maternal mortality ratio declined

from 1.7 maternal deaths per 1,000 live births in 1970 to 0.2 in 2000. Factors such as strengthening and expanding the maternal and child health services, accessibility to family planning services, and contraceptive use have been associated with this declining trend.

In 2016, the maternal mortality ratio was 0.49 maternal deaths per 1,000 live births (or 49 maternal deaths per 100,000 live births). It is noted that the maternal mortality ratio (i.e. maternal deaths per 1,000 live births) has fluctuated between 0.28 and 0.69 during the ten-year period of 2007 to 2016. As part of the renewed commitment from the government to improve further the reproductive health indicators, policies and strategies have been formulated and are being implemented.

## VITAL STATISTICS BY DISTRICT<sup>3</sup>

In 2016, the crude birth rates ranged from 8.0 in Flacq to 14.0 in Port Louis (*Table B.3*). Three districts had higher rates (Port Louis, Pamplemousses, and Black River) than the national level of 10.1.

In 2016, the crude death rates ranged from 5.9 in Black River to 10.7 in Port Louis (*Table B.4*). Four districts had higher rates (Port Louis, Grand Port, Savanne, and Plaines Wilhems) than the national level of 8.1.

In 2016, the still birth rates ranged from 6.3 in Moka to 11.8 in Pamplemousses (*Table B.5*). Five districts had higher rates (Port Louis, Pamplemousses, Rivière du Rempart, Grand Port, and Plaines Wilhems) than the national level of 9.4.

In 2016, the infant mortality rates ranged from 8.6 in Pamplemousses to 17.2 in Black River (*Table B.6*). Four districts had higher rates (Rivière du Rempart, Savanne, Moka, and Black River) than the national level of 11.6.

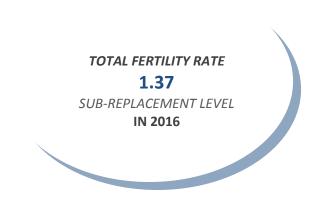

<sup>&</sup>lt;sup>3</sup> Island of Mauritius is divided into nine districts.

Family Planning And Demographic Yearbook 2016, Ministry Of Health And Quality Of Life

#### FERTILITY

There has been a remarkable decline in fertility in the past few decades as measured by the total fertility rate. The total fertility rate is the average number of babies that a woman could expect to bear if current fertility rates prevail throughout her reproductive lifetime. The total fertility rate dropped sharply from 5.86 children per woman in 1962 to 3.42 in 1972 and continued to drop further thereafter.

The total fertility rate dropped below the replacement-level fertility of 2.10 children per woman - the level needed for a woman to replace herself and her partner - for the first time in the mid-1980s; however, it was not until 1997 onward that fertility has continuously been at sub-replacement level. In 2016, the total fertility rate was 1.37 children per woman compared with 1.71 in 2007, resulting in a decrease of 19.9% (*Table B.7*).

In 2016, the fertility rates for women in the age groups 30-34 and 35-39 were higher than the corresponding rates in 2007, while in the other age groups, the fertility rates declined (*Table B.8*), and the largest percentage decreases in fertility rates were for women aged 20-24 (42.2%) and women aged 15-19 (36.7%).

Early childbearing increases health risks for both mothers and their newborns. The fertility rate for women aged 15-19 years (adolescent fertility rate) has declined from 35.4 in 2007 to 22.4 in 2016, resulting in a decline of 36.7%. Even though progress has been made in reducing the fertility rate among adolescents, it is noted that 24 live births occurred to adolescents under 15 years of age in 2016.

In 2016, the age-specific fertility rates showed that women *aged 25-29* years had the *highest* fertility rate (88.0) among all age groups, and that women *aged 30-34 years* (68.5) and women *aged 20-24 years* (57.2) had the *second* and *third* highest fertility rate respectively (*Table B.8*). It is noted that the fertility rate of women aged 30-34 years has surpassed that of women aged 20-24 years since 2014 (*Chart 18*).

The median age of childbearing has remained constant in 2015 and 2016 (28.1 years).

#### NUPTIALITY

#### **Island of Mauritius**

The 1962 and 1972 censuses showed that the proportion of currently married women in the age group 15-19 declined by slightly more than half, from 27.80% in 1962 to 12.50% in 1972 (*Table A.3*) whilst the average number of children per woman dropped from about 6 to 3 in the same period. Factors that have been linked to this sharp reduction in fertility between 1962 and 1972 include, among others, the postponement of marriage among younger women and contraceptive use. The last census, which was carried out in 2011, revealed that the proportions of currently married women in the age group 15-19 and 20-24 were 6.3% and 34.8% respectively.

The crude marriage rate has declined from 18.9 marriages per 1,000 mid-year population in 2007 to 16.2 in 2016, resulting in a drop of 14.3%. There were 9,882 marriages that were registered in the Island of Mauritius in 2016, and the majority of brides (83.3%) and bridegrooms (81.9%) had never been married before.

The median age of females and males at first marriage was 27.06 years and 30.08 years respectively in the Island of Mauritius in 2016. The median age at first marriage for females has increased by 0.36 years since 2015 and the median age at marriage for males has increased by 0.09 years since 2015.

#### **Republic of Mauritius**

The data shows that 2,161 divorces and 1,910 divorces have been granted in 2015 and 2016 respectively in the Republic of Mauritius. The crude divorce rate ranged between 2.1 to 3.6 during the period of 2007-2016 (*Chart 16*). In 2016, the crude divorce rate was 3.0 divorces per 1,000 mid-year population. Overall, 65.8% of all couples granted divorce in 2016 had at least one dependent child.

The crude marriage rate for the Republic of Mauritius ranged between 15.2 and 18.6 for the period of 2007-2016.

#### **FAMILY PLANNING**

#### Availability

Family planning services, including contraceptives, have been available to individuals and couples, free of user cost at government health service points since 1968. The government family planning programme provides a wide range of short-term and long-term contraceptive methods<sup>4</sup>.

However, availability of family planning services in Mauritius dates back since 1957 when the non-governmental organization (NGO) Mauritius Family Planning and Welfare Association (MFPWA) was set up. The MFPWA family planning programme was then integrated with the government maternal and child health programme in 1972, and thereafter, MFPWA has continued to run a family planning clinic where contraceptive methods and counselling services are offered. Moreover, the NGO Action Familiale, which was established in 1963, has been promoting use of natural family planning methods and has been providing counselling services.

There is a concerted effort between the Government, MFPWA, and Action Familiale to provide family planning services. The national family planning programme has long shifted its focus from achieving demographic targets to improving the reproductive health of the population. However, since its inception, the guiding principle of the family programme has been that all couples and individuals have the basic right to decide freely and responsibly the number, spacing, and timing of their children.

<sup>&</sup>lt;sup>4</sup> The short-term contraceptive methods are male condom; female condom; pill; 1-month injectable; and 3-month injectable, and the long-term contraceptive methods are implant; IUD; and tubal ligation. Emergency contraceptive pills are also available.

Family Planning And Demographic Yearbook 2016, Ministry Of Health And Quality Of Life

#### Family Planning Clients<sup>5</sup>

#### **New Acceptors**

In 2016, there were 4,126 new acceptors who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Mauritius (*Table C.1*). This figure includes 455 new acceptors of tubal ligation reported at government hospitals. Sympto-thermal was the most preferred method among the new acceptors accounting for 25.91%, followed by pill (20.58%), male condom (18.06%), 3-month injectable (17.74%), tubal ligation (11.03%), 1-month injectable (3.56%), IUD (1.70%), and implant (1.43%).

#### **Current Users**

As at 31<sup>st</sup> December 2016, there were 61,899 current users who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Mauritius (*Table C.11*). This figure includes 13,363 current users of tubal ligation reported at government hospitals. Sympto-thermal was the most preferred method among the current users accounting for 44.03%, followed by tubal ligation (23.27%), male condom (11.72%), pill (10.03%), 3-month injectable (4.94%), IUD (3.39%), implant (1.76%), and 1-month injectable (0.85%).

The average number of current users for the five-year period has declined from 81,247 in 2007-2011 to 65,775 in 2012-2016 (*Table C.10*), resulting in a decline of 19.0%.

<sup>&</sup>lt;sup>5</sup> There are different types of family planning clients, and they include new acceptors and current users. A new acceptor is someone who accepts a contraceptive method for the first time from a provider of a family planning programme. A current user is someone who uses a method of contraception that has been obtained from the provider of the family planning programme. It should be pointed out that since the number of family planning clients of female condom in the government is small, it has been excluded in this section (In 2016: 0 new acceptors and 5 current users for Island of Mauritius).

Family Planning And Demographic Yearbook 2016, Ministry Of Health And Quality Of Life

Moreover, the programme-based statistics (for the government, MFPWA, and Action Familiale) shows that 20.0% of women aged 15-49 years and 32.3% of currently married aged 15-49 years were using a contraceptive method in 2016. However, the Contraceptive Prevalence Survey, which was carried out in 2014, showed that higher proportions of women (40.9%) aged 15-49 years and of currently married women (63.8%) aged 15-49 years were using a contraceptive method in the Island of Mauritius. This nationwide survey revealed that women in the reproductive age group 15-49 years were obtaining their contraceptive method either from programme sources (government and NGOs) or from non-programme sources (e.g. pills from pharmacies) or were using non-programme methods (such as withdrawal).

#### Accessibility and Attendance

Government family planning services are available through an extensive network of health service points, covering the whole island of Mauritius<sup>6</sup> (*Appendix III*). Presently, there are 159 government family planning service points: 1 Community Hospital; 5 Medi-Clinics; 20 Area Health Centres; 117 Community Health Centres; 2 Family Health Clinics; 3 Family Planning Clinics; and 11 Industrial Family Supply Centres. Moreover, in relation to the population size, there were about 1,950 women in the reproductive age group (15-49 years) per government family planning service point.

In 2016, there was an attendance of 63,208 family planning clients at the government family planning service points.

In 2016, nine family planning clinics provided services after working hours, on Sundays and on public holidays.

<sup>&</sup>lt;sup>6</sup> For administrative purposes, five health regions have been established by the Ministry of Health and Quality of Life.

Family Planning And Demographic Yearbook 2016, Ministry Of Health And Quality Of Life

## **ISLAND OF RODRIGUES**

#### **VITAL STATISTICS**

There were 752 live births and 254 deaths that were registered in 2016 (Table F.1). The crude birth rate was 17.8 births per 1,000 mid-year population and the crude death rate was 6.0 deaths per 1,000 mid-year population in 2016. Hence, the rate of natural increase was 11.8 in 2016.

The crude birth rate has declined from 21.6 births per 1,000 live births in 2007 to 16.9 in 2015 and in 2016, it was 17.8.

The infant mortality rate has declined from 19.9 deaths per 1,000 live births in 2007 to 16.0 in 2015 and in 2016, it was 14.6.

The still birth rate has declined from 13.0 still births per 1,000 total births in 2007 to 11.6 in 2015 and in 2016, it was 13.1.

The total fertility rate has declined from 3.19 children per woman in 1990 to 2.19 in 2015 and in 2016, it was 2.33 (*Table F.2*). In 2016, the age-specific fertility rates showed that women *aged 25-29* years had the *highest* fertility rate (123.7) among all age groups and that women aged 30-34 years (100.3) had the *second* highest fertility rate (*Table F.3*).

#### **FAMILY PLANNING**

#### Family Planning Clients<sup>7</sup>

#### **New Acceptors**

In 2016, there were 315 new acceptors who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Rodrigues (*Table F.4*). Three-month injectable was the most preferred method among

<sup>&</sup>lt;sup>7</sup> Refer to footnote 5 for types of family planning clients. It should be pointed out that since the number of family planning clients of female condom in the government is small, it has been excluded in this section (In 2016: 0 new acceptors and 1 current user for Island of Rodrigues).

Family Planning And Demographic Yearbook 2016, Ministry Of Health And Quality Of Life

the new acceptors, accounting for 38.4%, followed by pill (35.6%) and sympto-thermal (12.7%).

#### **Current Users**

As at 31<sup>st</sup> December 2016, there were 4,586 current users who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Rodrigues (*Table F.5*). Pill was the most preferred method among the current users accounting for 33.9%, followed by sympto-thermal (25.8%), 3-month injectable (14.7%), male condom (11.6%), implant (7.4%), tubal ligation (3.9%), and IUD (2.7%).

#### Family Planning Service Points

In 2016, there were 16 government family planning service points in the Island of Rodrigues (*Table F.6*). Moreover, in relation to the population size, there were about 686 women in the reproductive age group (15-49 years) per government family planning service point. There was an attendance of 11,661 family planning clients at the government family planning service points in 2016.

Note: Medium variant projection - base year 2016

 $^{\Box}$  The ratio of the population below age 15 to that aged 15-64.

# The ratio of the population aged 65 & above to that aged 15-64.

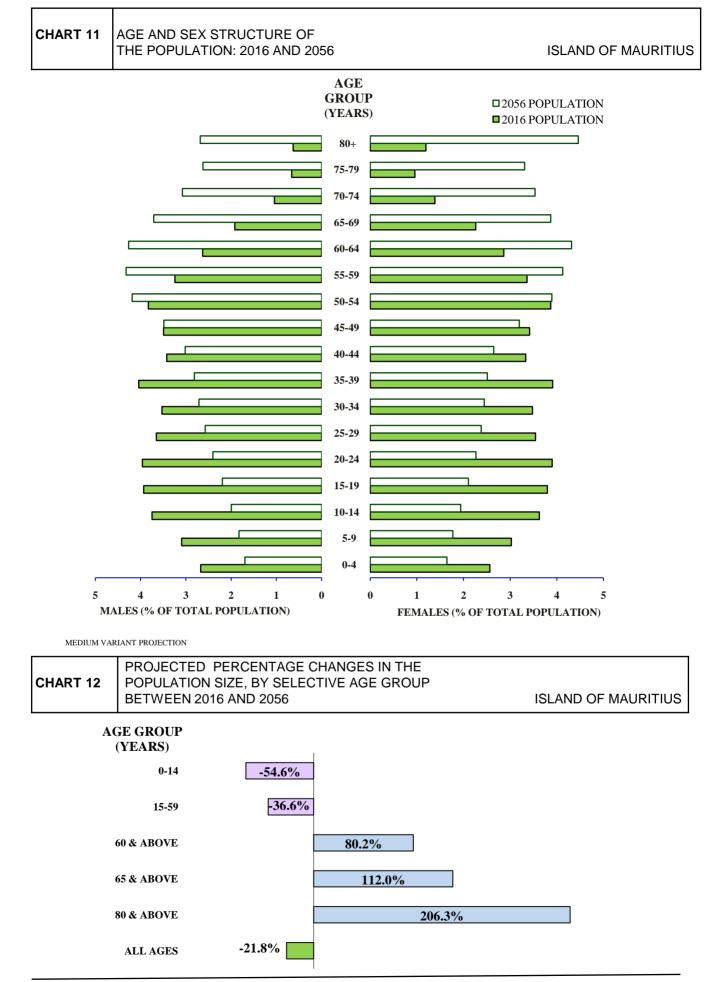

\* The ratio of the combined population below age 15 and population aged 65 & above to the population of intermediate aged 15-64.

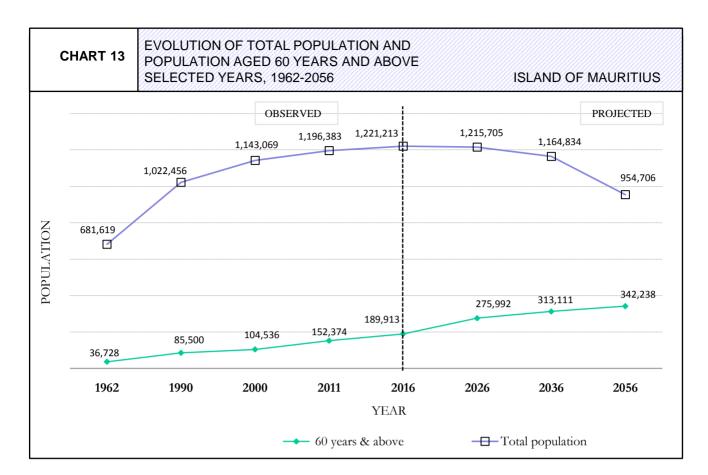

٥ Number of persons of working age (15-64 years) for each old person (aged 65 years and over).

• Number of persons aged 65 & above per 100 children below age 15.

<sup>#</sup> 1 Community Hospital in Health Region 5 (in Black River District) and 5 Medi Clinics in the other Health Regions

As at 31<sup>st</sup> December 2016 there were 1 Community Hospital, 5 Medi Clinics, 20 AHCs, 117 CHCs, 2 FHCs, 3 FPCs and 11 IFPSCs.

Family Planning and Demographic Yearbook 2016, Ministry of Health and Quality of Life

MEDI-CLINIC	Basic Health Services, Family Planning Services, Maternal and Child Health Services, Vaccination, Well Baby Clinic, Non Communicable Diseases Clinic, Community Based Rehabilitation, Pharmacy Services, HIV/AIDS, Health Education, Diabetes Clinic, Ultra Sound for ANC, Dental Services, Public Health Services, Radiology Services and Laboratory Services.
AREA HEALTH CENTRE (AHC)	Basic Health Services, Family Planning Services, Maternal and Child Health Services, Vaccination, Well Baby Clinic, Non Communicable Diseases Clinic, Community Based Rehabilitation, Pharmacy Services, HIV/AIDS, Health Education, Diabetes Clinic, Ultra Sound for ANC, Dental Services, Public Health Services.
COMMUNITY HEALTH CENTRE (CHC)	Basic Health Services, Family Planning Services, Maternal and Child Health Services, Vaccination, Well Baby Clinic, Non Communicable Diseases Clinic, Community Based Rehabilitation, Pharmacy Services, Health Education with Community Participation. May also have Dental Services.
FAMILY HEALTH CLINIC (FHC)	Family Planning Services, Maternal & Child Health Services, Well Baby Clinic, Health Education and Vaccination.
FAMILY PLANNING CLINIC (FPC)	Family Planning Services and Health Education.
FAMILY PLANNING SUPPLY CENTRES (FPSC)	Supply of pills, condoms and foaming tablets.
MOBILE FAMILY HEALTH CLINIC	Family Planning, Maternal & Child Health Services with doctor.
MOBILE FAMILY HEALTH SERVICES	Family Planning, Maternal & Child Health Services without doctor.
INDUSTRIAL FAMILY PLANNING SUPPLY CENTRE (IFPSC)	Supply of pills, condoms and foaming tablets and health education in industries.

Family Planning and Demographic Yearbook 2016, Ministry of Health and Quality of Life

# Glossary

Population	
Census	The total process of collecting, compiling and publishing data on the demographic, social and economic situation of all persons in a specified territory at a particular time. Decennial censuses are usually the norm.
De facto population	A population enumerated or estimated on the basis of those present at a particular time, including temporary visitors but excluding residents temporarily absent.
De jure population	A population enumerated or estimated on the basis of normal residence, excluding temporary visitors but including residents temporarily absent.
Density of population	A ratio of the number of people to the area of land that they occupy usually given as number of persons per square kilometer of area.
Natural increase	The excess of births over deaths.
Rate of natural increase	The difference between births and deaths occurring in a year per 1000 mid-year population. This rate is the difference between the 'crude birth rate' and the 'crude death rate'.
Population growth	The change in population size due to the three demographic processes, namely, births, deaths, and migration.
Doubling time	The number of years it would take for the population to double its current size at the current annual rate of growth.
Net external migration	The difference between international departure and arrivals of residents.
Age structure	
Sex ratio	The number of males per 100 females in a population.
Total dependency ratio	The combined child population (below 15 years) and older population (aged 60 years and above) per 1,000 population of the intermediate age (15-59 years).
Young-age dependency ratio (per 1000)	The ratio of the population below aged 15 years to that aged 15-59 years.

Old-age dependency The ratio of the population aged 60 years and above to that aged ratio (per 1000) 15-59 years.

Median age The age that divides a population into numerically two equal groups; one which is younger and the other which is older.

Population pyramid A graphic that portrays the age-sex distribution of the population.

## Fertility

Crude birth rate	The number of live births registered in a year per thousand estimated mid-year population.
Fertility	The childbearing performance of individuals, couples, groups or populations. It is contrasted with FECUNDITY, the theoretical capacity which may or may not lead to fertility.
General fertility rate	The number of live births occurring in a year per thousand estimated mid-year female population in their childbearing age (15-49 years).
Age-specific fertility rate	The number of live births occurring to women of a particular age or age group per year, normally expressed per 1,000 women. Five-year age groups from 15-19 to 45-49 are most commonly used.
Total fertility rate	The average number of <i>children</i> born to a woman assuming that she survives to the end of her childbearing age and is subjected to a fixed schedule of age-specific fertility rates.
Gross reproduction rate	The average number of <i>daughters</i> born to a woman assuming that she survives to the end of her childbearing age and is subjected to a fixed schedule of <i>age-specific fertility rates</i> . This is similar to the total fertility rate except that the gross reproduction rate counts only daughters.
Net Reproduction Rate	The average number of <i>daughters</i> that would be born to a woman during her lifetime if she passed through all her childbearing years conforming to a fixed schedule of <i>age-specific fertility rates and age-specific mortality</i> <i>rates.</i> The net reproduction rate is closely related to gross reproduction rate employing the same data on fertility but also indicating the effects of mortality.
Replacement level fertility	A net reproduction rate of 1.0 denotes replacement level fertility; the women are having just enough daughters to "replace" themselves in the population.
Mean age of Childbearing	The average age of mothers at the time of birth
Live birth order	The ordinal number of a given live birth in relation to all previous live births of the same woman.
Nuptiality	
Marriage rate	The annual number of men and women marrying per thousand mid-year population
Divorce rate	The annual number of men and women divorcing per thousand mid-year population.

### Mortality

Crude death rate	The number of deaths in a year per 1,000 mid-year population.
Infant deaths	The number of deaths occurring to children less than one year of age (0 - 364 days).
Infant mortality rate	The number of infant deaths in a year per 1,000 live births in the same year.
Child mortality rate	The number of deaths of children aged between one year and five years (1-4 years) in a year per 1,000 mid-year population aged between one year and five years (1-4 years) in the same year.
Under five mortality rate	The number of deaths of children aged under five years (0-4 years) in a year per 1,000 live births in the same year.
Still birth	The expulsion or extraction from the mother of a dead foetus after the time at which it would normally be presumed capable of independent extra uterine existence. This is taken to be after 28 weeks duration of pregnancy.
Still birth rate	The number of still births in a year per 1,000 total births (live births and still births).
Early neonatal mortality rate	The number of deaths of infants under one week (0-6 days) of age in a year per 1,000 live births in the same year.
Late neonatal mortality rate	The number of deaths of infants aged between one week and four weeks (7-27 days) in a year per 1,000 live births in the same year.
Neonatal mortality rate	The number of deaths of infants aged under four weeks (0-27 days) in a year per 1,000 live births in the same year.
Post neonatal mortality rate	The number of deaths of infants aged between four weeks and one year (28-364 days) in a year per 1,000 live births in the same year.
Perinatal mortality rate	The sum of the number of deaths of children aged under 7 days and the number of still births in a year per 1,000 total births (live births and still births) in the same year.
Maternal mortality	Mortality from causes connected with pregnancy, labour or the purperium (lying-in period).
Maternal mortality ratio	Number of deaths connected with pregnancy, labour or the purperium divided by the number of live births and expressed per 1000 or 100,000.
Life expectancy at birth	The average number of years a newborn can expect to live based on the mortality conditions at the time.

[ 99 ]

#### Family Planning Clients & Activities

New acceptor	Someone who accepts a contraceptive method for the first time from a provider of a family planning programme.
Current User	A new acceptor who continues with the same or different method of contraception and pays regular return visits to the family planning service point to receive services and supplies.
Drop out	A current user who does not show up at scheduled appointment or thereafter within a defined period (according to the contraceptive method) for services and contraceptive resupplies at a family planning service point.
Drop out returnee	A client who starts receiving again the services and supplies available at the family planning service point after temporarily failing to pay return visits at the service point.
Canvassing	The purpose of canvassing is to seek potential clients who will benefit from information and services at a family planning service point.
Follow-Up	The purpose of follow ups is to remind clients that they have missed a scheduled appointment and to encourage them to make a return visit to the family planning service point.
Session	Field visits made by community health worker for canvassing and follow-ups.

#### **Organisations and Acronyms**

ACTION FAMILIALE (A. F.)	Action Familiale, a non-governmental organisation, was established in 1963 at the initiative of Mgr J. Margeot, then Vicar General of the Mauritian Catholic Diocese. Besides, promoting sympto-thermal, which is a modern natural family planning method, Action Familiale provides a wide range of services which includes counselling services to couples and youth.
MAURITIUS FAMILY PLANNING & WELFARE ASSOCIATION (MFPWA)	The MFPWA, a non-governmental organisation, was set up in 1957 by some volunteers who believed that the rampant population growth rate would hinder social and economic development in Mauritius. The MFPWA promotes modern methods of contraception and is involved in family planning, women empowerment and advocacy related activities.

MATERNAL AND CHILDThe Maternal and Child Health/Family Planning Programme of theHEALTH/ FAMILY PLANNING<br/>(MCH/FP)Primary Health Care Division of the Ministry of Health and Quality of Life<br/>provides services that promote reproductive health.

## World Population Day 2017

Family Planning: Empowering People, Developing Nations

Access to safe, voluntary family planning is a human right. It is also central to gender equality and women's empowerment, and is a key factor in reducing poverty.	
Yet around the world, some 214 million women in developing countries who want to avoid pregnancy are not using safe and effective family planning methods, for reasons ranging from lack of access to information or services to lack of support from their partners or communities. Many of those with an unmet demand for contraceptives live in the poorest countries on earth.	
Investments in making family planning available also yields economic and other gains that can propel development forward.	
This year's World Population Day, 11 July, coincides with the Family Planning Summit, the second meeting of the FP2020–Family Planning 2020–initiative, which aims to expand access to voluntary family planning to 120 million additional women by 2020.
