

FAMILY PLANNING & DEMOGRAPHIC YEARBOOK 2017

VOLUME 43 OCTOBER 2018

DEMOGRAPHIC/EVALUATION UNIT MINISTRY OF HEALTH AND QUALITY OF LIFE

FOREWORD

Family planning advances individual's rights to decide freely and responsibly if, when and how many children to have, and helps to save women's and children's lives by preventing unintended pregnancies. Family planning has a ripple effect on many development goals of the country and is essential to a sustainable future. It also has an impact on the demography of the country.

The Family Planning and Demographic Yearbook presents data on population trends and family planning use and accessibility, amongst others, for both Island of Mauritius and Island of Rodrigues. This yearbook is intended for planners, policy makers, and the general public.

The data presented in the yearbook has been obtained from the different departments of this Ministry (the Primary Health Care Division, the Health Statistics Unit, the Health Records Division, and the Human Resource Section) as well as from Statistics Mauritius and the non-governmental organisations, namely Mauritius Family Planning and Welfare Association and Action Familiale.

The yearbook has been published by the Demographic/Evaluation Unit of the Ministry of Health and Quality of Life, which is responsible for monitoring and evaluating the national family planning programme, and its present issue is the forty-third volume.

Special thanks go to the staff of the Demographic/Evaluation Unit of this Ministry for their assistance in the compilation of this yearbook and to the staff of other departments and organisations for providing statistics that have been published in this yearbook.

J. Sunkur Chief Demographer October 2018

ANALYSIS	CONTENTS OF DEMOGRAPHIC & REPRODUCTIVE HEALTH INDICATORS DEMOGRAPHIC & REPRODUCTIVE HEALTH INDICATORS – ISLAND OF MAURITIUS	III-VI VII- XIX XXI-XXII
	ISLAND OF MAURITIUS	
TABLE	POPULATION	PAGE
A.1	Population at census dates by sex, sex ratio, population density and the annual intercensal growth rate, 1846-2011	1
A.2	Population enumerated at census dates by marital status and sex, 2000 and 2011	3
A.3	Proportion of currently and ever-married female population at census dates	4
A.4	Estimated mid-year resident population by age group and sex, 2016 and 2017	5
A.5	End of year estimated resident population by district & sex , 2015-2017, Republic of Mauritius	7
A.6	Population growth and vital statistics, 1988-2017	8
A.7	Life expectancy by age and sex, selected years	9
A.8	Projection of the resident population by sex, 2017-2037	10
A.9	Projection of the resident population by sex, 2042-2057	11
A.10	Distribution of the resident population at census years by selected age group, age indicators, dependency ratios (based on age 60 and over), and ageing index, selected years, 1962-2011	13
A.11	Distribution of the resident mid-year population by selected age group, age indicators, dependency ratios (based on age 60 and over), and ageing index, selected years, 2017-2057	14
A.12	Distribution of the resident population at census years by selected age group, age indicators, dependency ratios (based on age 65 and over), and ageing index, selected years , 1962-2011	16
A.13	Distribution of the resident mid-year population by selected age group, age indicators, dependency ratios (based on age 65 and over), and ageing index, selected years, 2017-2057	17
	VITAL STATISTICS	
B.1	Population and vital statistics rates, 1936-2017	21
B.2	Still births, perinatal, neonatal, infant and maternal deaths, 1982-2017	23
В.3	Crude birth rate by district, 1972, 1983, 1990, 2000, 2008-2017	25
B.4	Crude death rate by district, 1972, 1983, 1990, 2000, 2008-2017	25
B.5	Still birth rate by district , 1972, 1983, 1990, 2000, 2008-2017	26
B.6	Infant mortality rate by district, 1972, 1983, 1990, 2000, 2008-2017	26
B.7	Fertility rates, 1962, 1972, 1983, 1990, 2000, 2008-2017	27

25	Crude birth and death rates & infant mortality rates, 1990-2017, Island of Rodrigues	71
26	Number of new acceptors of contraceptive methods at primary health care centres by district (Government only) 2016-2017	93
27	Number of current users of contraceptive methods at primary health care centres by district (Government only) 2016-2017	95

A SUMMARY ON THE DEMOGRAPHIC AND FAMILY PLANNING STATISTICS

A summary of the statistics presented in the 2017 Family Planning and Demographic Yearbook is given in this section. The 2017 Yearbook is the forty-third volume and provides statistics for Island of Mauritius and Island of Rodrigues on demography as well as on family planning for the government and the two non-governmental organisations, namely Mauritius Family Planning and Welfare Association and Action Familiale. The tables and charts in this volume have been grouped under the following headings: population, vital statistics, and family planning.

ISLAND OF MAURITIUS

CENSUS

The last two censuses have been carried out in 2000 and 2011, and the *de jure*¹ counts revealed that there were 1,143,069 inhabitants and 1,196,383 inhabitants respectively, and that the population density has increased from 613 inhabitants per square kilometre in 2000 to 642 in 2011 (*Table A.1*). Moreover, it is noted that the average annual population growth rate of 0.42% for the period 2000-2011 was lower than the annual growth rate of 1.12% for the earlier intercensal period 1990-2000.

POPULATION SIZE, GROWTH AND DISTRIBUTION

The estimated resident population was 1,221,975 as at 1st July 2017, thus showing an increase of 762 persons since 1st July 2016 (*Table A.4*). Moreover, the estimated mid-year population in 2017 shows that there were more females than males: 617,195 females and 604,780 males.

¹ A population enumerated on the basis of normal residence, excluding temporary visitors but including residents temporarily absent.

The population growth rate was 0.09% in 2017 and if this rate is maintained, it will take more than 1,000 years for the population to double in size (*Table A.6*).

In 2017, an estimate of 42.1% of the population lived in urban areas and 57.9% lived in rural areas.

SEX RATIO

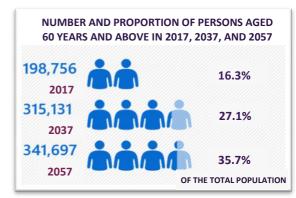

The sex ratio is a measure used to describe the balance between males and females in a population. In 2017, the sex ratio at birth was 105.0 males per 100 females (more boys were born than girls), and the sex ratio of the total population was 98.0 males per 100 females.

Due to the 'female survival advantage' in life expectancy, there are more females in the older age groups than in the younger age groups, and the gap increases with age. For instance, in 2017, there were 80.0 men per 100 women in the age group 60 and above and 52.8 men per 100 women in the age group 80 and above (*Chart 3*).

CHANGING AGE STRUCTURE

The population of Mauritius is ageing due to sustained low fertility level, resulting in a lower proportion of children in the population, and increasing life expectancy, resulting in a higher proportion of elders in the population. Hence, as the population is growing older, Mauritius is witnessing a change in its age structure.

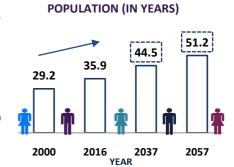

The proportion of the population aged 60 years and above has increased from 9.1% of the total mid-year population in 2000 to 16.3% in 2017, and it is projected² to increase to 27.1% in 2037 and 35.7% in 2057 (*Chart 7*).

² Medium variant projection based on 2017 population.

Conversely, the proportion of people aged 0-14 years has decreased from 25.0% of the total mid-year population in 2000 to 18.2% in 2017, and it is projected to decrease to 14.0% in 2037 and 11.3% in 2057. The proportion of the population aged 15-59 years has remained almost constant (65.8% of the total mid-year population in 2000 and 65.5% in 2017), and it is projected to decrease to 58.9% in 2037 and 53.0% in 2057.

Changes in the age structure are also reflected in the median age of the population; 50% of the population is older than this age and 50% is younger. The median age of the population has increased from 29.2 years in 2000 to 36.4 years in 2017, and it is projected to increase to 44.5 years in 2037 and 51.2 years in 2057.

MEDIAN AGE OF THE

Mauritius is also witnessing a progressive ageing of its older population itself. In 2017, persons aged 80 years or older comprised 11.6% of the elderly population (60 years and above), and it is projected that by 2057, they will comprise 20.4% of the elderly population (*Chart 8*). In other words, about 1 in 9 persons aged 60 years or older was 80 or above in 2017, and by 2057 this ratio is projected to increase to approximately 1 in 5.

Population pyramids are useful in examining the age-sex structure of a population. The juxtaposed population pyramids for year 2017 and 2057 show that due to the projected rise in the number and proportion of old people in the population, the apex of the 2057 pyramid is broader than that of the 2017 pyramid (*Chart 13*). Moreover, based on the projected changes in the age structure, there will be an increasingly demand for healthcare services for the elderly.

Another ramification of the changes in the age distribution is that the total dependency ratio will continue to increase: The share of the economically active population will decrease whilst the share of dependents will increase. The total dependency ratio compares the number of dependents (aged *0-14 years* and *60 years and above*) to the number of persons of working age (aged *15-59 years*); a higher ratio indicates a higher burden on the working population. The total dependency ratio has increased from 519.2 in 2000 to 525.9 in 2017, and it is projected to increase to 697.0 in 2037 and 886.9 in 2057 (*Table A.11*).

WOMEN IN THE REPRODUCTIVE AGE GROUP (15-49 YEARS)

The number and proportion of women in the reproductive age group (15-49 years) are important demographic factors to consider in a reproductive health (including family planning) programme. The proportion of the women in the reproductive age group (15-49 years) has decreased from 56.3% of the total mid-year female population in 2000 to 50.1% in 2017, and it is projected to decrease to 42.5% in 2037 and 34.9% in 2057 (Chart 9).

LIFE EXPECTANCY

Life expectancy at birth has improved considerably and is expected to improve further over the years: It increased from 69.3 years in 1989-1991 to 74.5 years in 2015-2017 (Table A.7). Likewise, female life expectancy at birth increased from 73.4 years in 1989-1991 to 77.9 years in 2015-2017 and male life expectancy at birth increased from 65.6 years in 1989-1991 to 71.2 years in 2015-2017. WOMEN ARE LIVING LONGER THAN MEN

LIFE EXPECTANCY AT BIRTH (IN YEARS) 2015-2017 74.5 BOTH SEXES 71.2

Life expectancy at birth is higher for females than for males but the gap between male and female life expectancy at birth is narrowing. The above-mentioned figures show that a girl born in 1989-1991 could expect to live 7.8 years longer than a boy born in the same period, and for a girl born in 2015-2017, she could expect to live 6.7 years longer.

Life expectancy at age 60 for the total population was 20.5 years in 2015-2017, and women aged 60 years in 2015-2017 could expect to live an additional 22.3 years, compared with 18.5 years for men aged 60 years in the same period.

VITAL STATISTICS

There were 12,671 live births and 9,914 deaths that were registered in 2017, resulting in a natural increase of 2,757 (live births minus deaths). Moreover, in 2017, there were 341 more live births and 6 less deaths than in 2016 (Table B.1).

The crude birth rate has declined from 12.9 births per 1,000 mid-year population in 2008 to 10.4 in 2017, and the crude death rate has increased from 7.3 deaths per 1,000

mid-year population in 2008 to 8.1 in 2017. Hence, the rate of natural increase was 5.6 in 2008 and 2.3 in 2017. Moreover it is noted that the average crude birth rate for the five-year period has declined, from 11.9 in 2008-2012 to 10.3 in 2013-2017. As for the crude death rate, it has fluctuated between 7.3 and 8.1 during the period of 2008-2017.

The infant mortality rate is often used as a proxy measure of the overall health of the population. There were 148 infant deaths (deaths under 1 year) that were registered in 2017, resulting to 5 more infant deaths than in 2016. The infant mortality rate has declined from 14.3 deaths per 1,000 live births in 2008 to 11.7 in 2017, resulting in a drop of 18.2%. Moreover, it is noted that the average infant mortality rate for the five-year period has declined, from 13.2 in 2008-2012 to 12.7 in 2013-2017.

During the period of 2008-2017, the early neonatal mortality rate has fluctuated between 4.9 and 6.8 deaths per 1,000 live births; in 2017 this rate was 6.0. Early neonatal deaths (deaths under 7 days) accounted for 51.4% of all infant deaths in 2017.

The number of still births was 128 in 2017, which was higher than in 2016 (117). The still birth rate has fluctuated between 6.6 and 10.1 during the period of 2008-2017; the lowest rate ever-recorded was in 2010. In 2017, the still birth rate was 10.0 still births per 1,000 total births.

The under-five mortality rate is a leading indicator of child health and overall human development. The under-five mortality rate (deaths under five years) has declined from 16.4 deaths per 1,000 live births in 2008 to 13.9 in 2017, resulting in a decrease of 15.2%. Moreover, the data shows that the average under-five year mortality rate for the five-year period has declined, from 15.6 in 2008-2012 to 14.6 in 2013-2017.

There has been a marked improvement in maternal health especially in the second half of the twentieth century (*Table B.2*). For instance, the maternal mortality ratio declined from 1.7 maternal deaths per 1,000 live births in 1970 to 0.2 in 2000. Factors such as strengthening and expanding the maternal and child health services, accessibility to

family planning services, and contraceptive use have been associated with this declining trend.

In 2017, the maternal mortality ratio was 0.79 maternal deaths per 1,000 live births (or 79 maternal deaths per 100,000 live births). It is noted that the maternal mortality ratio (i.e. maternal deaths per 1,000 live births) has fluctuated between 0.28 and 0.79 during the ten-year period of 2008 to 2017. As part of the renewed commitment from the government to improve further the reproductive health indicators, policies and strategies have been formulated and are being implemented.

VITAL STATISTICS BY DISTRICT³

In 2017, the crude birth rates ranged from 8.6 in Flacq to 14.2 in Port Louis (*Table B.3*). Three districts had higher rates (Port Louis, Pamplemousses, and Black River) than the national level of 10.4.

In 2017, the crude death rates ranged from 5.8 in Black River to 10.5 in Port Louis (*Table B.4*). Five districts had higher rates (Port Louis, Rivière du Rempart, Grand Port, Savanne, and Plaines Wilhems) than the national level of 8.1.

In 2017, the still birth rates ranged from 5.3 in Black River to 14.1 in Flacq (*Table B.5*). Four districts had higher rates (Pamplemousses, Flacq, Grand Port and Moka) than the national level of 10.0.

In 2017, the infant mortality rates ranged from 7.1 in Moka to 16.6 in Rivière du Rempart (*Table B.6*). Three districts had higher rates (Pamplemousses, Rivière du Rempart and Grand Port) than the national level of 11.7.

_

³ Island of Mauritius is divided into nine districts (see map).

FERTILITY

There has been a remarkable decline in fertility in the past few decades as measured by the total fertility rate. The total fertility rate is the average number of babies that a woman could expect to bear if current fertility rates prevail throughout her reproductive lifetime. The total fertility rate dropped sharply from 5.86 children per woman in 1962 to 3.42 in 1972 and continued to drop further thereafter.

The total fertility rate dropped below the replacement-level fertility of 2.10 children per woman - the level needed for a woman to replace herself and her partner - for the first time in the mid-1980s; however, it was not until 1997 onward that fertility has continuously been at sub-replacement level. In 2017, the total fertility rate was 1.41 children per woman compared with 1.64 in 2008, resulting in a decrease of 14.0% (*Table B.7*).

TOTAL FERTILITY RATE

1.41

AT SUB-REPLACEMENT LEVEL
IN 2017

In 2017, the fertility rates for women in the age groups 30-34 and 35-39 were higher than the corresponding rates in 2008, while in the other age groups, the fertility rates declined (*Table B.8*), and the largest percentage decreases in fertility rates were for women aged 20-24 (40.7%) and women aged 15-19 (32.5%).

Early childbearing increases health risks for both mothers and their newborns. The fertility rate for women aged 15-19 years (adolescent fertility rate) has declined from 34.2 in 2008 to 23.1 in 2017, resulting in a decline of 32.5%. Even though progress has been made in reducing the fertility rate among adolescents, it is noted that 30 live births occurred to adolescents under 15 years of age in 2017.

In 2017, the age-specific fertility rates showed that women *aged 25-29* years had the *highest* fertility rate (88.3) among all age groups, and that women *aged 30-34 years* (73.4) and women *aged 20-24 years* (55.7) had the *second* and *third* highest fertility rate respectively (*Table B.8*). It is noted that the fertility rate of women aged 30-34 years has surpassed that of women aged 20-24 years since 2014 (*Chart 20*).

The median age of childbearing has remained constant in 2016 and 2017 (28.1 years).

NUPTIALITY

Island of Mauritius

The 1962 and 1972 censuses showed that the proportion of currently married women in the age group 15-19 declined by slightly more than half, from 27.80% in 1962 to 12.50% in 1972 (*Table A.3*) whilst the average number of children per woman dropped from about 6 to 3 in the same period. Factors that have been linked to this sharp reduction in fertility between 1962 and 1972 include, among others, the postponement of marriage among younger women and contraceptive use. The last census, which was carried out in 2011, revealed that the proportions of currently married women in the age group 15-19 and 20-24 were 6.3% and 34.8% respectively.

The crude marriage rate has declined from 18.3 marriages per 1,000 mid-year population in 2008 to 15.7 in 2017, resulting in a drop of 14.2%. There were 9,586 marriages that were registered in the Island of Mauritius in 2017, and the majority of brides (83.5%) and bridegrooms (82.6%) had never been married before.

The median age of females and males at first marriage was 27.39 years and 30.03 years respectively in the Island of Mauritius in 2017. The median age at first marriage for females has increased by 0.33 years since 2016 and the median age at marriage for males has decreased by 0.05 years since 2016.

Republic of Mauritius

The data shows that 1,910 divorces and 1,996 divorces have been granted in 2016 and 2017 respectively in the Republic of Mauritius. The crude divorce rate ranged between 2.5 to 3.6 during the period of 2008-2017 (*Chart 18*). In 2017, the crude divorce rate was 3.2 divorces per 1,000 mid-year population. Overall, 65.9% of all couples granted divorce in 2017 had at least one dependent child.

The crude marriage rate for the Republic of Mauritius ranged between 15.2 and 18.0 for the period of 2008-2017.

FAMILY PLANNING

Availability

Family planning helps save women's and children's lives by preventing unplanned pregnancies. Family planning services, including contraceptives, have been available to individuals and couples, free of user cost at government health service points since late 60s.

The government family planning programme provides a wide range of short-term and long-term contraceptive methods⁴ through a network of health service points.

FAMILY PLANNING BENEFITS

- Advances human rights
- Saves lives
- Prevents HIV/AIDS transmission
- Helps reduce poverty
- Advances gender equality and empowerment
- Supports the achievement of the sustainable development goals (SDGs)

However, availability of family planning services in Mauritius dates back since 1957 when the non-governmental organization (NGO) Mauritius Family Planning and Welfare Association (MFPWA) was set up. The MFPWA family planning programme was then integrated with the government maternal and child health programme in 1972, and thereafter, MFPWA has continued to run a family planning clinic where contraceptive methods and counselling services are offered. Moreover, the NGO Action Familiale, which was established in 1963, has been promoting use of natural family planning methods and has been providing counselling services.

There is a concerted effort between the Government, MFPWA, and Action Familiale to provide family planning services. The national family planning programme has long shifted its focus from achieving demographic targets to improving the reproductive health of the population. However, since its inception, the guiding principle of the family programme has been that all couples and individuals have the basic right to decide freely and responsibly the number, spacing, and timing of their children.

⁴ The short-term contraceptive methods are male condom; female condom; pill; 1-month injectable; and 3-month injectable, and the long-term contraceptive methods are implant; IUD; and tubal ligation. Emergency contraceptive pills are also available.

Family Planning Clients⁵

New Acceptors

In 2017, there were 3,726 new acceptors who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Mauritius (Table C.1). This figure includes 526 new acceptors of tubal ligation reported at government hospitals. Pill was the most preferred method among the new acceptors accounting for 22.71%, followed by sympto-thermal (22.33%), 3-month injectable (18.46%), male condom (16.75%), tubal ligation (14.12%), 1-month injectable (2.98%), IUD (1.58%), and implant (1.07%).

Current Users

As at 31st December 2017, there were 60,204 current (GOVERNMENT, MFPWA & ACTION FAMILIALE) users who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Mauritius (Table C.11). This figure includes 13,421 current users of tubal ligation reported at government hospitals.

Sympto-thermal was the most preferred method among the current users accounting for 44.93%, followed by tubal ligation (23.81%), male condom (11.20%), pill (9.45%), 3month injectable (4.95%), IUD (3.29%), implant (1.52%), and 1-month injectable (0.86%).

The average number of current users for the five-year period has declined from 77,520 in 2008-2012 to 64,054 in 2013-2017 (*Table C.10*), resulting in a decline of 17.4%.

⁵ There are different types of family planning clients, and they include new acceptors and current users. A new acceptor is someone who accepts a contraceptive method for the first time from a provider of a family planning programme. A current user is someone who uses a method of contraception that has been obtained from the provider of the family planning programme. It should be pointed out that since the number of family planning clients of female condom in the government is small; it has been excluded in this section (In 2017: 0 new acceptors and 4 current users for Island of Mauritius).

Moreover, the programme-based statistics (for the government, MFPWA, and Action Familiale) shows that 19.5% of women aged 15-49 years and 31.5% of currently married aged 15-49 years were using a contraceptive method in 2017. However, the Contraceptive Prevalence Survey, which was carried out in 2014, showed that higher proportions of women (40.9%) aged 15-49 years and of currently married women (63.8%) aged 15-49 years were using a contraceptive method in the Island of Mauritius. This nationwide survey revealed that women in the reproductive age group 15-49 years were obtaining their contraceptive method either from programme sources (government and NGOs) or from non-programme sources (e.g. pills from pharmacies) or were using non-programme methods (such as withdrawal).

Accessibility and Attendance

Government family planning services are available through an extensive network of health service points, covering the whole island of Mauritius⁶ (*Appendix III*). Presently, there are 159 government family planning service points: 1 Community Hospital; 5 Medi-Clinics; 20 Area Health Centres; 117 Community Health Centres; 2 Family Health Clinics; 3 Family Planning Clinics; and 11 Industrial Family Supply Centres. Hence, in relation to the population size, there were about 1,943 women in the reproductive age group (15-49 years) per government family planning service point.

In 2017, a total number of 55,896 attendances have been recorded at the government family planning service points.

In 2017, six family planning clinics provided services after working hours, on Sundays and on public holidays.

⁶ For administrative purposes, five health regions have been established by the Ministry of Health and Quality of Life.

ISLAND OF RODRIGUES

POPULATION SIZE

The estimated mid-year population in 2017 was 42,638 in 2017, and the sex ratio of the total population was 97 males per 100 females. The estimated number of women in the reproductive age group (15-49 years) was 11,087 in 2017.

VITAL STATISTICS

There were 808 live births and 226 deaths that were registered in 2017 (Table F.1). The crude birth rate was 19.0 births per 1,000 mid-year population and the crude death rate was 5.3 deaths per 1,000 mid-year population in 2017. Hence, the rate of natural increase was 13.7 in 2017.

The crude birth rate has declined from 20.0 births per 1,000 live births in 2008 to 17.7 in 2016 and in 2017, it was 19.0.

The infant mortality rate has declined from 15.3 deaths per 1,000 live births in 2008 to 15.6 in 2016 and in 2017, it was 19.8.

The still birth rate has declined from 11.0 still births per 1,000 total births in 2008 to 10.6 in 2016 and in 2017, it was 8.6.

The total fertility rate has declined from 3.19 children per woman in 1990 to 2.31 in 2016 and in 2017, it was 2.52 (*Table F.2*). In 2017, the age-specific fertility rates showed that women *aged 25-29* years had the *highest* fertility rate (125.0) among all age groups and that women aged 30-34 years (114.0) had the *second* highest fertility rate (*Table F.3*).

The fertility rate for women aged 15-19 years (adolescent fertility rate) has declined from 75.2 in 1990 to 54.2 in 2016 and in 2017, it was 57.9.

FAMILY PLANNING

Family Planning Clients⁷

New Acceptors

In 2017, there were 349 new acceptors who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Rodrigues (*Table F.4*). Three-month injectable was the most preferred method among the new acceptors, accounting for 44.4%, followed by pill (30.7%), sympto-thermal and male condom (9.5%) respectively.

Current Users

As at 31st December 2017, there were 4,325 current users who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Rodrigues (*Table F.5*). Pill was the most preferred method among the current users accounting for 33.8%, followed by sympto-thermal (26.4%), 3-month injectable (15.6%), male condom (11.4%), implant (6.1%), tubal ligation (3.8%), and IUD (2.9%).

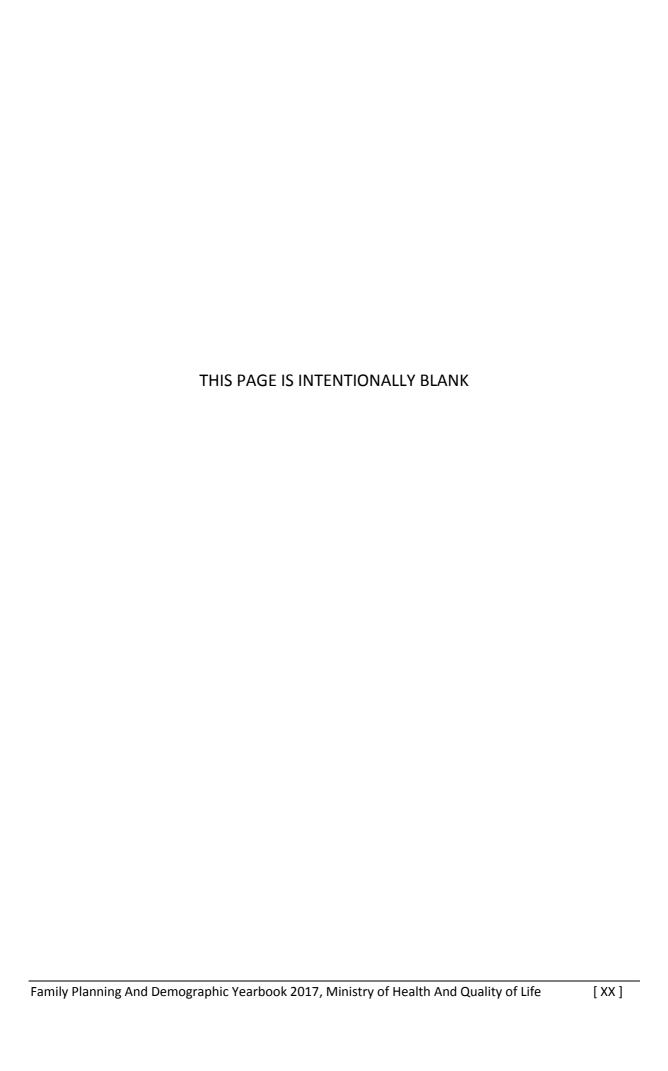

Family Planning Service Points

In 2017, there were 15 government family planning service points in the Island of Rodrigues (*Table F.6*). Hence, in relation to the population size, there were about 694 women in the reproductive age group (15-49 years) per government family planning service point.

Attendance

In 2017, a total number of 11,465 attendances have been recorded at the government family planning service points.

⁷ Refer to footnote 5 for types of family planning clients. It should be pointed out that since the number of family planning clients of female condom in the government is small; it has been excluded in this section (In 2017: 0 new acceptors and current users for Island of Rodrigues).

 $^{^{\}square}$ The ratio of the population below age 15 to that aged 15-59.

 $^{^{\}hbox{\tt\#}}$ The ratio of the population aged 60 & above to that aged 15-59.

^{*} The ratio of the combined population below age 15 and population aged 60 & above to the population of intermediate aged 15-59.

Number of persons of working age (15-59 years) for each old person (aged 60 years and over).

[•] Number of persons aged 60 & above per 100 children below age 15.

Note: Medium variant projection - base year 2017

[☐] The ratio of the population below age 15 to that aged 15-64.

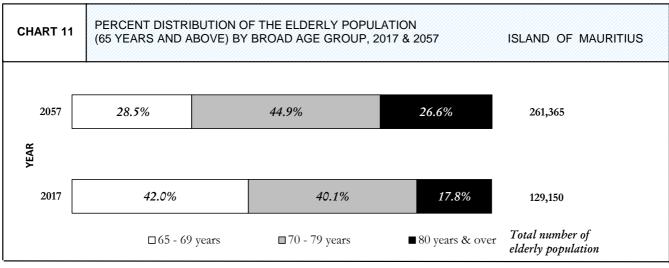

[#] The ratio of the population aged 65 & above to that aged 15-64.

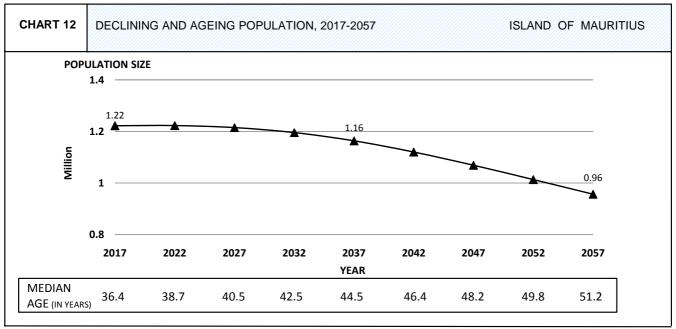

^{*} The ratio of the combined population below age 15 and population aged 65 & above to the population of intermediate aged 15-64.

Number of persons of working age (15-64 years) for each old person (aged 65 years and over).

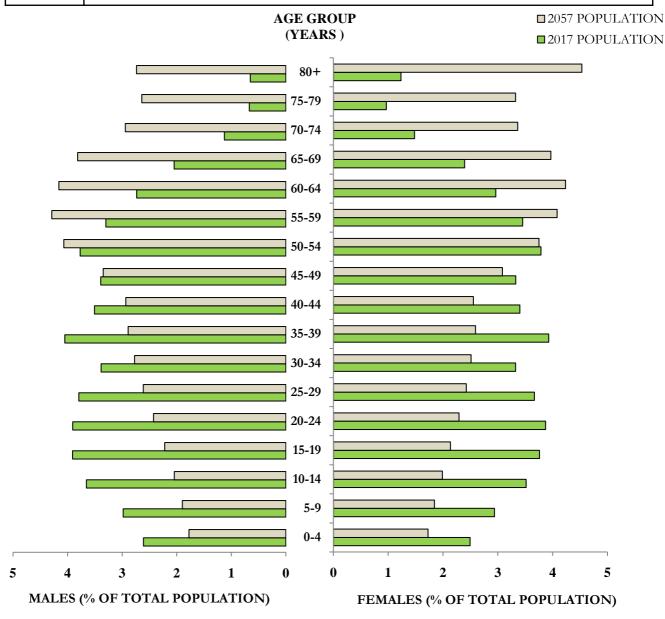

[•] Number of persons aged 65 & above per 100 children below age 15.

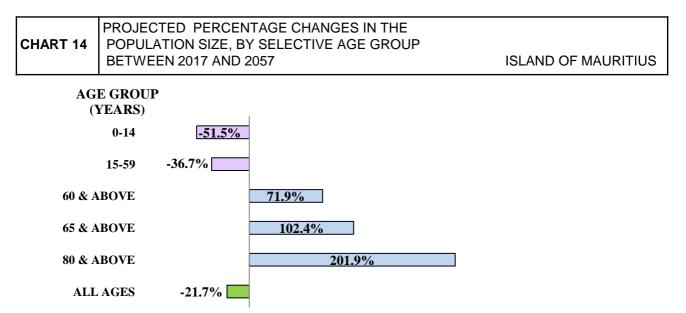

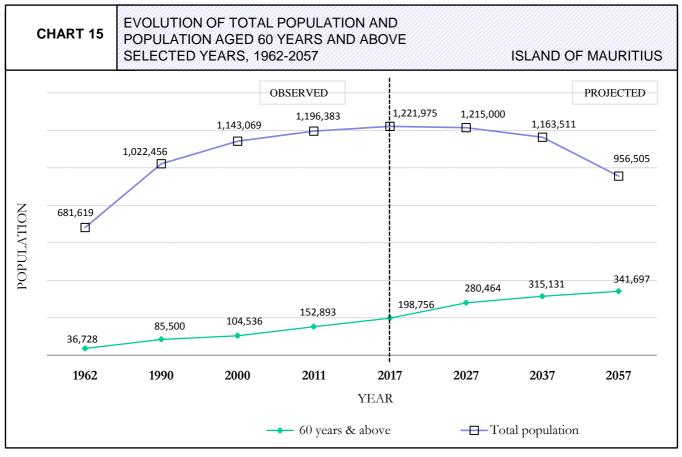

NOTE: MEDIUM VARIANT PROJECTION

Glossary

Population

Census The total process of collecting, compiling and publishing data on the

demographic, social and economic situation of all persons in a specified territory at a particular time. Decennial censuses are usually the norm.

De facto population A population enumerated or estimated on the basis of those present at a

particular time, including temporary visitors but excluding residents

temporarily absent.

De jure population A population enumerated or estimated on the basis of normal residence,

excluding temporary visitors but including residents temporarily absent.

Density of population A ratio of the number of people to the area of land that they occupy

usually given as number of persons per square kilometer of area.

Natural increase The excess of births over deaths.

Rate of natural increase The difference between births and deaths occurring in a year per 1000

mid-year population. This rate is the difference between the 'crude birth

rate' and the 'crude death rate'.

Population growth The change in population size due to the three demographic processes,

namely, births, deaths, and migration.

Doubling time The number of years it would take for the population to double its

current size at the current annual rate of growth.

Net external migration The difference between international departure and arrivals of residents.

Age structure

Sex ratio The number of males per 100 females in a population.

Total dependency ratio The combined child population (below 15 years) and older population

(aged 60 years and above) per 1,000 population of the intermediate age

(15-59 years).

Young-age dependency

ratio (per 1000)

The ratio of the population below aged 15 years to that aged 15-59

years.

Old-age dependency

ratio (per 1000)

The ratio of the population aged 60 years and above to that aged

15-59 years.

Median age The age that divides a population into numerically two equal groups; one

which is younger and the other which is older.

Population pyramid A graphic that portrays the age-sex distribution of the population.

Fertility

Crude birth rate The number of live births registered in a year per thousand estimated

mid-year population.

Fertility The childbearing performance of individuals, couples, groups or

populations. It is contrasted with FECUNDITY, the theoretical capacity

which may or may not lead to fertility.

General fertility rate The number of live births occurring in a year per thousand estimated

mid-year female population in their childbearing age (15-49 years).

The number of live births occurring to women of a particular age or age Age-specific fertility rate

group per year, normally expressed per 1,000 women. Five-year age

groups from 15-19 to 45-49 are most commonly used.

Total fertility rate The average number of *children* born to a woman assuming that she

survives to the end of her childbearing age and is subjected to a fixed

schedule of age-specific fertility rates.

The average number of *daughters* born to a woman assuming that she Gross reproduction rate

survives to the end of her childbearing age and is subjected to a fixed schedule of age-specific fertility rates. This is similar to the total fertility rate except that the gross reproduction rate counts only daughters.

Net Reproduction Rate The average number of *daughters* that would be born to a woman during

her lifetime if she passed through all her childbearing years conforming to a fixed schedule of age-specific fertility rates and age-specific mortality rates. The net reproduction rate is closely related to gross reproduction rate employing the same data on fertility but also indicating the effects of

mortality.

Replacement level fertility The level of fertility at which a population exactly replaces itself from one

generation to the next and it is taken to be an average of 2.1 children per woman. Alternatively, a net reproduction rate of 1.0 denotes replacement level fertility; the women are having just enough daughters

to "replace" themselves in the population.

Mean age of Childbearing

The average age of mothers at the time of birth

Live birth order The ordinal number of a given live birth in relation to all previous live

births of the same woman.

Nuptiality

Marriage rate The annual number of men and women marrying per thousand mid-year

population

Divorce rate The annual number of men and women divorcing per thousand mid-year

population.

Mortality

Crude death rate	The number of deaths in a year per 1,000 mid-year population.
Infant deaths	The number of deaths occurring to children less than one year of age (0 - 364 days).
Infant mortality rate	The number of infant deaths in a year per 1,000 live births in the same year.
Child mortality rate	The number of deaths of children aged between one year and five years (1-4 years) in a year per 1,000 mid-year population aged between one year and five years (1-4 years) in the same year.
Under five mortality rate	The number of deaths of children aged under five years (0-4 years) in a year per 1,000 live births in the same year.
Still birth	The expulsion or extraction from the mother of a dead foetus after the time at which it would normally be presumed capable of independent extra uterine existence. This is taken to be after 28 weeks duration of pregnancy.
Still birth rate	The number of still births in a year per 1,000 total births (live births and still births).
Early neonatal mortality rate	The number of deaths of infants under one week (0-6 days) of age in a year per 1,000 live births in the same year.
Late neonatal mortality rate	The number of deaths of infants aged between one week and four weeks (7-27 days) in a year per 1,000 live births in the same year.
Neonatal mortality rate	The number of deaths of infants aged under four weeks (0-27 days) in a year per 1,000 live births in the same year.
Post neonatal mortality rate	The number of deaths of infants aged between four weeks and one year (28-364 days) in a year per 1,000 live births in the same year.
Perinatal mortality rate	The sum of the number of deaths of children aged under 7 days and the number of still births in a year per 1,000 total births (live births and still births) in the same year.
Maternal mortality	Mortality from causes connected with pregnancy, labour or the purperium (lying-in period).
Maternal mortality ratio	Number of deaths connected with pregnancy, labour or the purperium divided by the number of live births and expressed per 1000 or 100,000.
Life expectancy at birth	The average number of years a newborn can expect to live based on the mortality conditions at the time.

Family Planning Clients & Activities

Someone who accepts a contraceptive method for the first time from a New acceptor

provider of a family planning programme.

Current User A new acceptor who continues with the same or different method of

contraception and pays regular return visits to the family planning service

point to receive services and supplies.

Drop out A current user who does not show up at scheduled appointment or

thereafter within a defined period (according to the contraceptive method) for services and contraceptive resupplies at a family planning service

point.

Drop out returnee A client who starts receiving again the services and supplies available at

the family planning service point after temporarily failing to pay return

visits at the service point.

Canvassing The purpose of canvassing is to seek potential clients who will benefit

from information and services at a family planning service point.

Follow-Up The purpose of follow ups is to remind clients that they have missed a

scheduled appointment and to encourage them to make a return visit to

the family planning service point.

Session Field visits made by community health worker for canvassing and follow-

ups.

Organisations and Acronyms

ACTION FAMILIALE (A. F.) Action Familiale, a non-governmental organisation, was established in

1963 at the initiative of Mgr J. Margeot, then Vicar General of the Mauritian Catholic Diocese. Besides, promoting sympto-thermal, which is a modern natural family planning method, Action Familiale provides a wide range of services which includes counselling services to couples and

youth.

MAURITIUS FAMILY PLANNING & WELFARE ASSOCIATION (MFPWA)

The MFPWA, a non-governmental organisation, was set up in 1957 by some volunteers who believed that the rampant population growth rate would hinder social and economic development in Mauritius. The MFPWA promotes modern methods of contraception and is involved in many family planning, women empowerment and advocacy related activities.

MATERNAL AND CHILD HEALTH/ FAMILY PLANNING (MCH/FP)

The Ministry of Health and Quality of Life administers the Maternal and Child Health/Family Planning Programme which promotes reproductive health. The Family Planning Programme was integrated with the Maternal and Child Health Services in 1972. Family planning services are available, free of user cost, through a network of health service points.

WORLD POPULATION DAY 2018

FAMILY PLANNING IS A HUMAN RIGHT

Fifty years ago, the United Nations International Conference on Human Rights resolved in the Proclamation of Teheran of 13 May 1968: "Parents have a basic human right to determine freely and responsibly the number and the spacing of their children." Introducing a resolution on family planning that was reflected in the Proclamation, the delegate who coordinated negotiations on the resolution declared that it, "says 'yes' to planning by the family and 'no' to planning for the family." Family planning was, therefore, a human right for couples to exercise, **not** "population control" to be imposed by the State. World Population Day 2018 commemorates this landmark agreement. World Population Day is about countering any notion of "population control", ensuring that future generations never take a hard-won human right for granted, and about strengthening the global rights and development frameworks that support it. Despite tremendous progress since 1968, hundreds of millions of women, men and young people are unable to exercise the right to plan their families, and 214 million women still lack modern contraceptives.
