

FAMILY PLANNING & DEMOGRAPHIC YEARBOOK 2018

VOLUME 44 NOVEMBER 2019

DEMOGRAPHIC/EVALUATION UNIT MINISTRY OF HEALTH AND WELLNESS

THIS PAGE IS INTENTIONALLY BLANK

FOREWORD

Family planning advances individual's rights to decide freely and responsibly if, when and how many children to have, and helps to save women's and children's lives by preventing unintended pregnancies. Family planning has a ripple effect on many development goals of the country and is essential to a sustainable future. It also has an impact on the demography of the country.

The Family Planning and Demographic Yearbook presents data on population trends and family planning use and accessibility, amongst others, for both Island of Mauritius and Island of Rodrigues. This yearbook is intended for planners, policy makers, and the general public.

The data presented in the yearbook has been obtained from the different departments of this Ministry (the Primary Health Care Division, the Health Statistics Unit, the Health Records Division, and the Human Resource Section) as well as from Statistics Mauritius and the non-governmental organisations, namely Mauritius Family Planning and Welfare Association and Action Familiale.

The yearbook has been published by the Demographic/Evaluation Unit of the Ministry of Health and Wellness, which is responsible for monitoring and evaluating the national family planning programme, and its present issue is the forty-fourth volume.

Special thanks go to the staff of the Demographic/Evaluation Unit of this Ministry for their assistance in the compilation of this yearbook and to the staff of other departments and organisations for providing statistics that have been published in this yearbook.

ISLAND OF MAURITIUS

LIST OF TABLES

POPULATION

TABL	E PAGE
A.1	Population at census dates by sex, sex ratio, population density and the annual intercensal growth rate, 1846-2011
A.2	Population enumerated at census dates by marital status and sex, 2000 and 2011
A.3	Proportion of currently and ever-married female population at census dates 4
A.4	Estimated mid-year resident population by age group and sex, 2017 and 2018
A.5	Estimated end-year resident population by district & sex, 2016-2018 7
A.6	Population growth and vital statistics, 1989-2018
A.7	Life expectancy by age and sex, selected years
A.8	Projection of the resident population by sex, 2018-2038
A.9	Projection of the resident population by sex, 2043-2058
A.10	Distribution of the resident population at census years by selected age group, age indicators, dependency ratios (based on age 60 and over), and ageing index, selected years, 1962-2011
A.11	Distribution of the resident mid-year population by selected age group, age indicators, dependency ratios (based on age 60 and over), and ageing index, selected years, 2018-2058
A.12	Distribution of the resident population at census years by selected age group, age indicators, dependency ratios (based on age 65 and over), and ageing index, selected years, 1962-2011
A.13	Distribution of the resident mid-year population by selected age group, age indicators, dependency ratios (based on age 65 and over), and ageing index, selected years, 2018-2058
	VITAL STATISTICS
B.1	Population and vital statistics rates, 1936-201821
B.2	Still births, perinatal, neonatal, infant and maternal deaths, 1984-201823
B.3	Crude birth rate by district, 1972, 1983, 1990, 2000, 2009-201825

TABLE OF CONTENTS

TABLE	PAGE
B.4	Crude death rate by district, 1972, 1983, 1990, 2000, 2009-2018
B.5	Still birth rate by district , 1972, 1983, 1990, 2000, 2009-2018
B.6	Infant mortality rate by district, 1972, 1983, 1990, 2000, 2009-2018
B.7	Fertility rates, 1962, 1972, 1983, 1990, 2000, 2009-2018
B.8	Age-specific fertility rates by age of mother: 1962, 1972, 1986, 2000, 2009-2018
B.9	Age-specific fertility rates by age of mother and live birth order, 2017 & 2018 29
B.10	Live births occurred by age of mother and live birth order , 2017 & 2018 30
B.11	Trend in fertility rates by live birth order, 2009-2018
B.12	Projected demographic rates (medium variant), 2018-2058
	FAMILY PLANNING
	NEW ACCEPTORS
C.1	Number of new acceptors by family planning method according to organisation, 2009-2018
C.2	Number of new acceptors of pill by district and organisation, 2009-2018 34
C.3	Number of new acceptors of male condom by district and organisation, 2009-2018
C.4	Number of new acceptors of IUD by district and organisation, 2009-2018 36
C.5	Number of new acceptors of 3-month injectable by district and organisation, 2009-2018
C.6	Number of new acceptors of sympto-thermal by district, 2009-201838
C.7	Total number of new acceptors by district, 2009-201839
C.8	Total number of new acceptors by method, according to district, 201841
C.9	Number of new acceptors of family planning methods and of service points by organisation, 2014-2018
	CURRENT USERS
C.10	Number of current users by family planning method according to organisation, 2009-2018
C.11	Number of current users by family planning method, according to district and
C.12	organisation as at 31 st December 2018

TABLE		PAGE
C.13	Number of current users of male condom by district and organisation as at 31 st December, 2009-2018	47
C.14	Number of current users of intra-uterine device by district and organisation as at 31 st December, 2009-2018	48
C.15	Number of current users of 3-month injectable by district and organisation a at 31st December, 2009-2018	
C.16	Number of current users of implant by district and organisation as at 31st December,2009-2018	50
C.17	Number of current users of 1-month injectable by district and organisation a at 31st December, 2010-2018	
C.18	Number of current users of sympto-thermal by district as at 31 st December, 2009-2018	52
C.19	Number of current users by district and organisation as at 31st December, 2009-2018	53
	CONTRACEPTIVE COMMODITIES	
C.20	Distribution of contraceptive commodities to family planning clients by organisation,1998-2018	54

A SUMMARY ON THE DEMOGRAPHIC AND FAMILY PLANNING STATISTICS

A summary of the statistics presented in the 2018 Family Planning and Demographic Yearbook is given in this section. The 2018 Yearbook is the forty-fourth volume and provides statistics for Island of Mauritius and Island of Rodrigues on demography as well as on family planning for the government and the two non-governmental organisations, namely Mauritius Family Planning and Welfare Association and Action Familiale. The tables and charts in this volume have been grouped under the following headings: population, vital statistics, and family planning.

ISLAND OF MAURITIUS

CENSUS

The last two censuses have been carried out in 2000 and 2011, and the *de jure*¹ counts revealed that there were 1,143,069 inhabitants and 1,196,383 inhabitants respectively, and that the population density has increased from 613 inhabitants per square kilometre in 2000 to 642 in 2011 (*Table A.1*). Moreover, it is noted that the average annual population growth rate of 0.42% for the period 2000-2011 was lower than the annual growth rate of 1.12% for the earlier intercensal period 1990-2000.

POPULATION SIZE, GROWTH AND DISTRIBUTION

The estimated resident population was 1,222,268 as at 1st July 2018, thus showing an increase of 293 persons since 1st July 2017 (*Table A.4*). Moreover, the estimated mid-year population in 2018 shows that there were more females than males: 617,353 females and 604,915 males.

¹ A population enumerated on the basis of normal residence, excluding temporary visitors but including residents temporarily absent.

The population growth rate was 0.00% in 2018 and if this rate is maintained, it will take more than 1,000 years for the population to double in size (*Table A.6*).

In 2018, an estimate of 42.0% of the population lived in urban areas and 58.0% lived in rural areas.

SEX RATIO

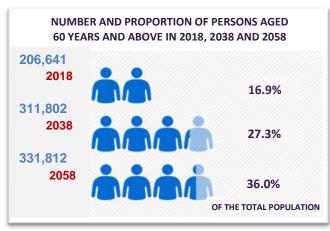

The sex ratio is a measure used to describe the balance between males and females in a population. In 2018, the sex ratio at birth was 105.2 males per 100 females (more boys were born than girls), and the sex ratio of the total population was 98.0 males per 100 females.

Due to the 'female survival advantage' in life expectancy, there are more females in the older age groups than in the younger age groups, and the gap increases with age. For instance, in 2018, there were 80.2 men per 100 women in the age group 60 and above and 53.1 men per 100 women in the age group 80 and above (*Chart 3*).

CHANGING AGE STRUCTURE

The population of Mauritius is ageing due to sustained low fertility level, resulting in a lower proportion of children in the population, and increasing life expectancy, resulting in a higher proportion of elders in the population. Hence, as the population is growing older, Mauritius is witnessing a change in its age structure.

The proportion of the population aged 60 years and above has increased from 9.1% of the total mid-year population in 2000 to 16.9% in 2018, and it is projected² to increase to 27.3% in 2038 and 36.0% in 2058 (*Chart 7*).

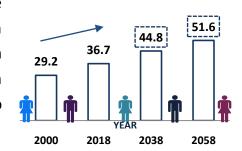

² Medium variant projection based on 2018 population.

Conversely, the proportion of the population aged 0-14 years has decreased from 25.0% of the total mid-year population in 2000 to 17.7% in 2018, and it is projected to decrease to 13.6% in 2038 and 10.9% in 2058. The proportion of the population aged 15-59 years has remained almost constant (65.8% of the total mid-year population in 2000 and 65.4% in 2018), and it is projected to decrease to 59.1% in 2038 and 53.0% in 2058.

MEDIAN AGE OF THE POPULATION (IN YEARS)

Changes in the age structure are also reflected in the median age of the population; 50% of the population is older than this age and 50% is younger. The median age of the population has increased from 29.2 years in 2000 to 36.7 years in 2018, and it is projected to increase to 44.8 years in 2038 and 51.6 years in 2058.

Mauritius is also witnessing a progressive ageing of its older population itself. In 2018, persons aged 80 years or older comprised 11.4% of the elderly population (60 years and above), and it is projected that by 2058, they will comprise 18.3% of the elderly population (*Chart 8*). In other words, about 1 in 9 persons aged 60 years or older was 80 or above in 2018, and by 2058 this ratio is projected to increase to approximately 1 in 5.

Population pyramids are useful in examining the age-sex structure of a population. The juxtaposed population pyramids for year 2018 and 2058 show that due to the projected rise in the number and proportion of old people in the population, the apex of the 2058 pyramid is broader than that of the 2018 pyramid (*Chart 13*). Moreover, based on the projected changes in the age structure, there will be an increasingly demand for healthcare services for the elderly.

Another ramification of the changes in the age distribution is that the total dependency ratio will continue to increase: The share of the economically active population will decrease whilst the share of dependents will increase. The total dependency ratio compares the number of dependents (aged *0-14 years* and *60 years and above*) to the number of persons of working age (aged *15-59 years*); a higher ratio indicates a higher burden on the working population. The total dependency ratio has increased from 519.2 in 2000 to 528.2 in 2018, and it is projected to increase to 693.2 in 2038 and 885.1 in 2058 (*Table A.11*).

WOMEN IN THE REPRODUCTIVE AGE GROUP (15-49 YEARS)

The number and proportion of women in the reproductive age group (15-49 years) are important demographic factors to consider in a reproductive health (including family planning) programme. The proportion of the women in the reproductive age group (15-49 years) has decreased from 56.3% of the total mid-year female population in 2000 to 49.8% in 2018, and it is projected to decrease to 42.8% in 2038 and 34.8% in 2058 (Chart 9).

LIFE EXPECTANCY

Life expectancy at birth has improved considerably and is expected to improve further over the years. It increased from 69.3 years in 1989-1991 to 74.4 years in 2016-2018 (Table A.7). Likewise, female life expectancy at birth increased from 73.4 years in 1989-1991 to 77.7 years in 2016-2018 and male life expectancy at birth increased from 65.6 years in 1989-1991 to 71.2 years in 2016-2018. WOMEN ARE LIVING LONGER THAN MEN

Life expectancy at birth is higher for females than for males but the gap between male and female life expectancy at birth is narrowing. The above-mentioned figures show that a girl born in 1989-1991 could expect to live 7.8 years longer than a boy born in the same period, and for a girl born in 2016-2018, she could expect to live 6.5 years longer.

Life expectancy at age 60 for the total population was 20.5 years in 2016-2018, and women aged 60 years in 2016-2018 could expect to live an additional 22.2 years, compared with 18.5 years for men aged 60 years in the same period.

VITAL STATISTICS

There were 12,202 live births and 10,521 deaths that were registered in 2018, resulting in a natural increase of 1,681 (live births minus deaths). Moreover, in 2018, there were 469 less live births and 607 more deaths than in 2017 (Table B.1).

The crude birth rate has declined from 12.1 births per 1,000 mid-year population in 2009 to 10.0 in 2018, and the crude death rate has increased from 7.4 deaths per 1,000 mid-year population in 2009 to 8.6 in 2018. Hence, the rate of natural increase was 4.7 in 2009 and 1.4 in 2018. Moreover it is noted that the average crude birth rate for the five-year period has declined, from 11.5 in 2009-2013 to 10.2 in 2014-2018. As for the crude death rate, it has fluctuated between 7.3 and 8.6 during the period of 2009-2018.

The infant mortality rate is often used as a proxy measure of the overall health of the population. There were 168 infant deaths (deaths under 1 year) that were registered in 2018, resulting to 20 more infant deaths than in 2017. The infant mortality rate has increased from 13.3 deaths per 1,000 live births in 2009 to 13.8 in 2018, resulting in a rise of 3.8%. However, it is noted that the average infant mortality rate for the five-year period has increased from 12.8 in 2009-2013 to 13.0 in 2014-2018.

The neonatal mortality rate is a key outcome indicator for newborn care and directly reflects prenatal, intrapartum, and neonatal care. During the period of 2009-2018, the neonatal mortality rate has fluctuated between 7.6 and 10.5 deaths per 1,000 live births; in 2018, this rate was 10.5. Neonatal deaths (deaths under 28 days) accounted for 76.2% of all infant deaths in 2018.

The number of still births was 123 in 2018, which was lower than in 2017 (128). The still birth rate has fluctuated between 6.6 and 10.1 during the period of 2009-2018; the lowest rate ever-recorded was in 2010. In 2018, the still birth rate was 10.0 still births per 1,000 total births.

The under-five mortality rate is a leading indicator of child health and overall human development. The under-five mortality rate (deaths under five years) has increased from 16.2 deaths per 1,000 live births in 2009 to 16.3 in 2018, resulting in an increase of 0.6%. Moreover, the data shows that the average under-five year mortality rate for the five-year period has declined, from 15.3 in 2009-2013 to 14.9 in 2014-2018.

There has been a marked improvement in maternal health especially in the second half of the twentieth century (*Table B.2*). For instance, the maternal mortality ratio declined from 1.7 maternal deaths per 1,000 live births in 1970 to 0.2 in 2000. Factors such as strengthening and expanding the maternal and child health services, accessibility to

family planning services, and contraceptive use have been associated with this declining trend.

In 2018, the maternal mortality ratio was 0.41 maternal deaths per 1,000 live births (or 41 maternal deaths per 100,000 live births). It is noted that the maternal mortality ratio (i.e. maternal deaths per 1,000 live births) has fluctuated between 0.28 and 0.79 during the ten-year period of 2009 to 2018. As part of the renewed commitment from the government to improve further the reproductive health indicators, policies and strategies have been formulated and are being implemented.

VITAL STATISTICS BY DISTRICT³

In 2018, the crude birth rates ranged from 7.7 in Flacq to 14.3 in Port Louis (*Table B.3*). Three districts had higher rates (Port Louis, Pamplemousses, and Black River) than the national level of 10.0.

In 2018, the crude death rates ranged from 6.0 in Black River to 11.4 in Port Louis (*Table B.4*). Three districts had higher rates (Port Louis, Grand Port and Plaines Wilhems) than the national level of 8.6.

In 2018, the still birth rates ranged from 4.6 in Savanne to 14.5 in Port Louis (*Table B.5*). Five districts had higher rates (Port Louis, Pamplemousses, Flacq, Moka and Black River) than the national level of 10.0.

In 2018, the infant mortality rates ranged from 8.6 in Black River to 19.9 in Rivière du Rempart (*Table B.6*). Four districts had higher rates (Port Louis, Pamplemousses, Rivière du Rempart and Moka) than the national level of 13.8.

_

³ Island of Mauritius is divided into nine districts (see map).

FERTILITY

There has been a remarkable decline in fertility in the past few decades as measured by the total fertility rate. The total fertility rate is the average number of babies that a woman could expect to bear if current fertility rates prevail throughout her reproductive lifetime. The total fertility rate dropped sharply from 5.86 children per woman in 1962 to 3.42 in 1972 and continued to drop further thereafter.

The total fertility rate dropped below the replacement-level fertility of 2.10 children per woman - the level needed for a woman to replace herself and her partner - for the first time in the mid-1980s; however, it was not until 1997 onward that fertility has continuously been at sub-replacement level. In 2018, the total fertility rate was 1.37 children per woman compared with 1.57 in 2009, resulting in a decrease of 12.7% (*Table B.7*).

TOTAL FERTILITY RATE
1.37
AT SUB-REPLACEMENT LEVEL
IN 2018

In 2018, the fertility rates for women in the age groups 30-34, 35-39 and 40-44 were higher than the corresponding rates in 2009, while in the other age groups, the fertility rates declined (*Table B.8*), and the largest percentage decreases in fertility rates were for women aged 45-49 (40.0%) and women aged 20-24 (39.4%).

Early childbearing increases health risks for both mothers and their newborns. The fertility rate for women aged 15-19 years (adolescent fertility rate) has declined from 32.8 in 2009 to 23.0 in 2018, resulting in a decline of 29.9%. Even though progress has been made in reducing the fertility rate among adolescents, it is noted that 29 live births occurred to adolescents under 15 years of age in 2018.

In 2018, the age-specific fertility rates showed that women *aged 25-29* years had the *highest* fertility rate (83.1) among all age groups, and that women *aged 30-34 years* (74.8) and women *aged 20-24 years* (53.3) had the *second* and *third* highest fertility rate respectively (*Table B.8*). It is noted that the fertility rate of women aged 30-34 years has surpassed that of women aged 20-24 years since 2014 (*Chart 20*).

The median age of childbearing has increased from 28.5 years in 2017 to 28.7 years in 2018.

NUPTIALITY

Island of Mauritius

The 1962 and 1972 censuses showed that the proportion of currently married women in the age group 15-19 declined by slightly more than half, from 27.80% in 1962 to 12.50% in 1972 (*Table A.3*) whilst the average number of children per woman dropped from about 6 to 3 in the same period. Factors that have been linked to this sharp reduction in fertility between 1962 and 1972 include, among others, the postponement of marriage among younger women and contraceptive use. The last census, which was carried out in 2011, revealed that the proportions of currently married women in the age group 15-19 and 20-24 were 6.3% and 34.8% respectively.

The crude marriage rate has declined from 17.3 marriages per 1,000 mid-year population in 2009 to 16.1 in 2018, resulting in a drop of 6.9%. There were 9,834 marriages that were registered in the Island of Mauritius in 2018, and the majority of brides (84.0%) and bridegrooms (83.3%) had never been married before.

The median age of females and males at first marriage was 27.35 years and 29.97 years respectively in the Island of Mauritius in 2018. The median age at first marriage for females has increased by 0.04 years since 2017 and the median age at marriage for males has decreased by 0.06 years since 2017.

Republic of Mauritius

The data shows that 1,996 divorces and 2,425 divorces have been granted in 2017 and 2018 respectively in the Republic of Mauritius. The crude divorce rate ranged between 2.5 to 3.8 during the period of 2009-2018 (*Chart 18*). In 2018, the crude divorce rate was 3.8 divorces per 1,000 mid-year population. Overall, 62.6% of all couples granted divorce in 2018 had at least one dependent child.

The crude marriage rate for the Republic of Mauritius ranged between 15.2 and 17.0 for the period of 2009-2018.

FAMILY PLANNING

Availability

Family planning helps save women's and children's lives by preventing unplanned pregnancies. Family planning services, including contraceptives, have been available to individuals and couples, free of user cost at government health service points since 1968.

The government family planning programme provides a wide range of short-term and long-term contraceptive methods⁴ through a network of health service points.

FAMILY PLANNING BENEFITS

- Advances human rights
- Saves lives
- Prevents HIV/AIDS transmission
- Helps reduce poverty
- Advances gender equality and empowerment
- Supports the achievement of the sustainable development goals (SDGs)

However, availability of family planning services in Mauritius dates back since 1957 when the non-governmental organization (NGO) Mauritius Family Planning and Welfare Association (MFPWA) was set up. The MFPWA family planning programme was then integrated with the government maternal and child health programme in 1972, and thereafter, MFPWA has continued to run a family planning clinic where contraceptive methods and counselling services are offered. Moreover, the NGO Action Familiale, which was established in 1963, has been promoting use of natural family planning methods and has been providing counselling services.

There is a concerted effort between the Government, MFPWA, and Action Familiale to provide family planning services. The national family planning programme has long shifted its focus from achieving demographic targets to improving the reproductive health of the population. However, since its inception, the guiding principle of the family programme has been that all couples and individuals have the basic right to decide freely and responsibly the number, spacing, and timing of their children.

⁴ The short-term contraceptive methods are male condom; female condom; pill; 1-month injectable; and 3-month injectable, and the long-term contraceptive methods are implant; IUD; and tubal ligation. Emergency contraceptive pills are also available.

Family Planning Clients⁵

New Acceptors

In 2018, there were 3,741 new acceptors who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Mauritius (Table C.1). This figure includes 499 new acceptors of tubal ligation reported at government hospitals. Sympto-thermal was the most preferred method among the new acceptors accounting for 21.57%, followed by pill (20.37%), 3-month injectable (19.27%), male condom (18.31%), tubal ligation (13.34%), 1-month injectable (3.23%), implant (2.46%) and IUD (1.44%).

Current Users

As at 31st December 2018, there were 58,513 current (GOVERNMENT, MFPWA & ACTION FAMILIALE) users who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Mauritius (Table C.11). This figure includes 13,450 current users of tubal ligation reported at government hospitals.

Sympto-thermal was the most preferred method among the current users accounting for 45.19%, followed by tubal ligation (24.37%), male condom (11.19%), pill (8.64%), 3-month injectable (4.88%), IUD (3.26%), implant (1.61%), and 1-month injectable (0.86%).

The average number of current users for the five-year period has declined from 73,357 in 2009-2013 to 62,275 in 2014-2018 (Table C.10), resulting in a decline of 15.1%.

⁵ There are different types of family planning clients, and they include new acceptors and current users. A new acceptor is someone who accepts a contraceptive method for the first time from a provider of a family planning programme. A current user is someone who uses a method of contraception that has been obtained from the provider of the family planning programme. It should be pointed out that since the number of family planning clients of female condom in the government is small; it has been excluded in this section (In 2018: 1 new acceptor and 5 current users for Island of Mauritius).

Moreover, the programme-based statistics (for the government, MFPWA, and Action Familiale) shows that 19.0% of women aged 15-49 years and 30.8% of currently married aged 15-49 years were using a contraceptive method in 2018. However, the Contraceptive Prevalence Survey, which was carried out in 2014, showed that higher proportions of women (40.9%) aged 15-49 years and of currently married women (63.8%) aged 15-49 years were using a contraceptive method in the Island of Mauritius. This nationwide survey revealed that women in the reproductive age group 15-49 years were obtaining their contraceptive method either from programme sources (government and NGOs) or from non-programme sources (e.g. pills from pharmacies) or were using non-programme methods (such as withdrawal).

Accessibility and Attendance

Government family planning services are available through an extensive network of health service points, covering the whole island of Mauritius⁶ (*Appendix III*). Presently, there are 158 government family planning service points: 1 Community Hospital; 5 Medi-Clinics; 20 Area Health Centres; 117 Community Health Centres; 2 Family Health Clinics; 3 Family Planning Clinics; and 10 Industrial Family Supply Centres. Hence, in relation to the population size, there were about 1,947 women in the reproductive age group (15-49 years) per government family planning service point.

In 2018, a total number of 50,610 attendances have been recorded at the government family planning service points.

In 2018, six family planning clinics provided services after working hours, on Sundays and on public holidays.

⁶ For administrative purposes, five health regions have been established by the Ministry of Health and Wellness of

ISLAND OF RODRIGUES

VITAL STATISTICS

There were 763 live births and 266 deaths that were registered in 2018 (Table F.1). The crude birth rate was 17.7 births per 1,000 mid-year population and the crude death rate was 6.2 deaths per 1,000 mid-year population in 2018. Hence, the rate of natural increase was 11.5 in 2018.

The crude birth rate has declined from 18.7 births per 1,000 live births in 2009 to 18.2 in 2017 and in 2018, it was 17.7.

The infant mortality rate has increased from 14.9 deaths per 1,000 live births in 2009 to 17.2 in 2017 and in 2018, it was 17.0.

The still birth rate has declined from 8.5 still births per 1,000 total births in 2009 to 10.2 in 2017 and in 2018, it was 9.1.

The total fertility rate has declined from 3.19 children per woman in 1990 to 2.42 in 2017 and in 2018, it was 2.40 (*Table F.2*). In 2018, the age-specific fertility rates showed that women *aged 25-29* years had the *highest* fertility rate (124.7) among all age groups and that women aged 30-34 years (109.3) had the *second* highest fertility rate (*Table F.3*).

FAMILY PLANNING

Family Planning Clients⁷

New Acceptors

In 2018, there were 261 new acceptors who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Rodrigues (*Table F.4*). Three-month injectable was the most preferred method among

⁷ Refer to footnote 5 for types of family planning clients. It should be pointed out that since the number of family planning clients of female condom in the government is small; it has been excluded in this section (In 2017: 0 new acceptors and current users for Island of Rodrigues).

the new acceptors, accounting for 41.0%, followed by pill (37.2%) and male condom (11.1%).

Current Users

As at 31st December 2018, there were 4,094 current users who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Rodrigues (*Table F.5*). Pill was the most preferred method among the current users accounting for 33.6%, followed by sympto-thermal (27.1%), 3-month injectable (13.1%), male condom (12.4%), implant (6.9%), tubal ligation (3.9%), and IUD (3.0%).

AS AT 31ST DECEMBER 2018

Family Planning Service Points

In 2018, there were 15 government family planning service points in the Island of Rodrigues (*Table F.6*). Hence, in relation to the population size, there were about 745 women in the reproductive age group (15-49 years) per government family planning service point.

Attendance

In 2018, a total number of 10,842 attendances have been recorded at the government family planning service points.

[®] Registered live births per 1,000 mid-year population.

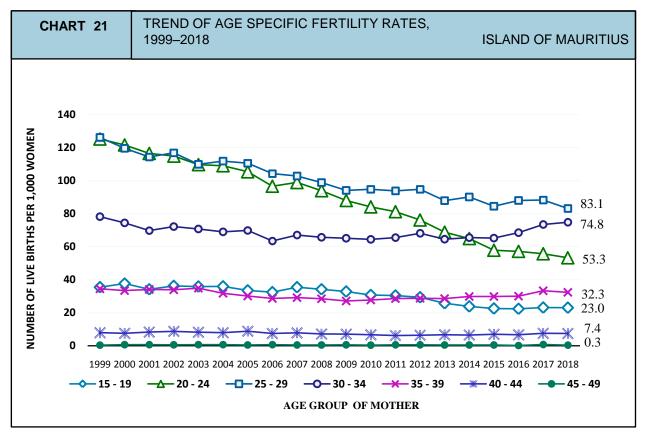

[#] Live births per 1,000 women aged 15-49 years.

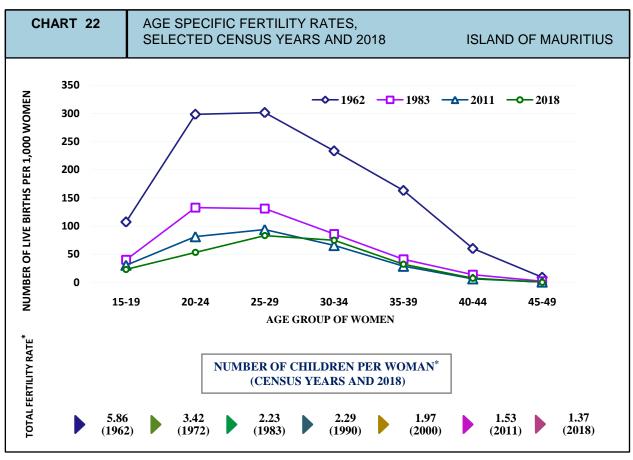

^{**} The average number of children born to a woman assuming that she survives to the end of her childbearing age and is subjected to a fixed schedule of age-specific fertility rates.

[^] The average number of daughters born to a woman assuming that she survives to her childbearing age and is subjected to a fixed schedule of age-specific fertility rates.

⁺ The average number of daughters that would be born to a woman during her litetime if she passed through all her childbearing years conforming to a fixed schedule of age-specific fertility rates and age-specific mortality rates.

[~] Live births occurred per 1,000 women in each age-group.

Glossary

Population

Census The total process of collecting, compiling and publishing data on the

demographic, social and economic situation of all persons in a specified territory at a particular time. Decennial censuses are usually the norm.

particular time, including temporary visitors but excluding residents

temporarily absent.

De jure population A population enumerated or estimated on the basis of normal residence,

excluding temporary visitors but including residents temporarily absent.

Density of population A ratio of the number of people to the area of land that they occupy

usually given as number of persons per square kilometer of area.

Natural increase The excess of births over deaths.

Rate of natural increase The difference between births and deaths occurring in a year per 1000

mid-year population. This rate is the difference between the 'crude birth

rate' and the 'crude death rate'.

Population growth The change in population size due to the three demographic processes,

namely, births, deaths, and migration.

Doubling time The number of years it would take for the population to double its

current size at the current annual rate of growth.

Net external migration The difference between international departure and arrivals of residents.

Age structure

Sex ratio The number of males per 100 females in a population.

Total dependency ratio The combined child population (below 15 years) and older population

(aged 60 years and above) per 1,000 population of the intermediate age

(15-59 years).

Young-age dependency

ratio (per 1000)

The ratio of the population below aged 15 years to that aged 15-59

years.

Old-age dependency

ratio (per 1000)

The ratio of the population aged 60 years and above to that aged

15-59 years.

Median age The age that divides a population into numerically two equal groups; one

which is younger and the other which is older.

Population pyramid A graphic that portrays the age-sex distribution of the population.

Fertility

Crude birth rate The number of live births registered in a year per thousand estimated

mid-year population.

Fertility The childbearing performance of individuals, couples, groups or

populations. It is contrasted with FECUNDITY, the theoretical capacity

which may or may not lead to fertility.

General fertility rate The number of live births occurring in a year per thousand estimated

mid-year female population in their childbearing age (15-49 years).

Age-specific fertility rate
The number of live births occurring to women of a particular age or age

group per year, normally expressed per 1,000 women. Five-year age

groups from 15-19 to 45-49 are most commonly used.

Total fertility rate The average number of *children* born to a woman assuming that she

survives to the end of her childbearing age and is subjected to a fixed

schedule of age-specific fertility rates.

Gross reproduction rate The average number of *daughters* born to a woman assuming that she

survives to the end of her childbearing age and is subjected to a fixed schedule of *age-specific fertility rates*. This is similar to the total fertility

rate except that the gross reproduction rate counts only daughters.

her lifetime if she passed through all her childbearing years conforming to a fixed schedule of *age-specific fertility rates and age-specific mortality rates*. The net reproduction rate is closely related to gross reproduction rate employing the same data on fertility but also indicating the effects of

mortality.

Replacement level fertility
The level of fertility at which a population exactly replaces itself from one

generation to the next and it is taken to be an average of 2.1 children per woman. Alternatively, a net reproduction rate of 1.0 denotes replacement level fertility; the women are having just enough daughters

to "replace" themselves in the population.

Mean age of Childbearing

The average age of mothers at the time of birth

Live birth order The ordinal number of a given live birth in relation to all previous live

births of the same woman.

Nuptiality

Marriage rate The annual number of men and women marrying per thousand mid-year

population

Divorce rate The annual number of men and women divorcing per thousand mid-year

population.

Mortality

Crude death rate The number of deaths in a year per 1,000 mid-year population. Infant deaths The number of deaths occurring to children less than one year of age (0 - 364 days).Infant mortality rate The number of infant deaths in a year per 1,000 live births in the same vear. Child mortality rate The number of deaths of children aged between one year and five years (1-4 years) in a year per 1,000 mid-year population aged between one year and five years (1-4 years) in the same year. Under five mortality rate The number of deaths of children aged under five years (0-4 years) in a year per 1,000 live births in the same year. Still birth The expulsion or extraction from the mother of a dead foetus after the time at which it would normally be presumed capable of independent extra uterine existence. This is taken to be at or after 28 weeks duration of pregnancy. Still birth rate The number of still births in a year per 1,000 total births (live births and still births). Early neonatal mortality rate The number of deaths of infants under one week (0-6 days) of age in a year per 1,000 live births in the same year. Late neonatal mortality rate The number of deaths of infants aged between one week and four weeks (7-27 days) in a year per 1,000 live births in the same year. Neonatal mortality rate The number of deaths of infants aged under four weeks (0-27 days) in a year per 1,000 live births in the same year. Post neonatal mortality rate The number of deaths of infants aged between four weeks and one year (28-364 days) in a year per 1,000 live births in the same year. Perinatal mortality rate The sum of the number of deaths of children aged under 7 days and the number of still births in a year per 1,000 total births (live births and still births) in the same year. Maternal mortality Mortality from causes connected with pregnancy, labour or the purperium (lying-in period). Maternal mortality ratio Number of deaths connected with pregnancy, labour or the purperium divided by the number of live births and expressed per 1000 or 100,000. Life expectancy at birth The average number of years a newborn can expect to live based on the mortality conditions at the time.

Family Planning Clients & Activities

New acceptor Someone who accepts a contraceptive method for the first time from a

provider of a family planning programme.

Current User A new acceptor who continues with the same or different method of

contraception and pays regular return visits to the family planning service

point to receive services and supplies.

Drop out A current user who does not show up at scheduled appointment or

thereafter within a defined period (according to the contraceptive method) for services and contraceptive resupplies at a family planning service

point.

Drop out returnee A client who starts receiving again the services and supplies available at

the family planning service point after temporarily failing to pay return

visits at the service point.

Canvassing The purpose of canvassing is to seek potential clients who will benefit

from information and services at a family planning service point.

Follow-Up The purpose of follow ups is to remind clients that they have missed a

scheduled appointment and to encourage them to make a return visit to

the family planning service point.

Session Field visits made by community health worker for canvassing and follow-

ups.

Organisations and Acronyms

ACTION FAMILIALE (A. F.) Action Familiale, a non-governmental organisation, was established in

1963 at the initiative of Mgr J. Margeot, then Vicar General of the Mauritian Catholic Diocese. Besides, promoting sympto-thermal, which is a modern natural family planning method, Action Familiale provides a wide range of services which includes counselling services to couples and

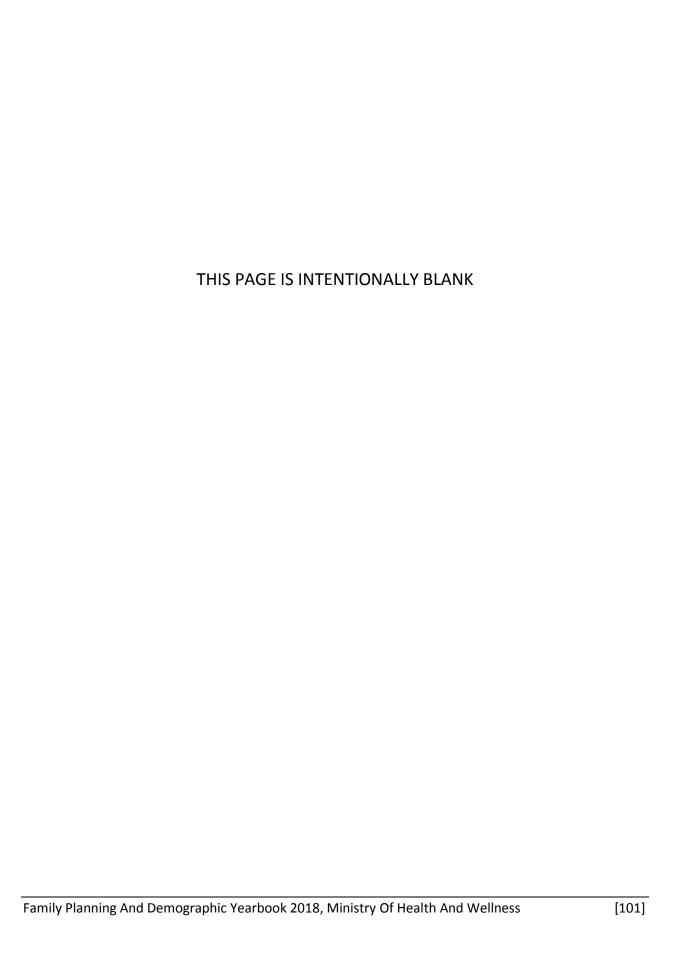

youth.

MAURITIUS FAMILY PLANNING & WELFARE ASSOCIATION

(MFPWA)

The MFPWA, a non-governmental organisation, was set up in 1957 by some volunteers who believed that the rampant population growth rate would hinder social and economic development in Mauritius. The MFPWA promotes modern methods of contraception and is involved in many family planning, women empowerment and advocacy related activities.

MATERNAL AND CHILD HEALTH/ FAMILY PLANNING (MCH/FP) The Ministry of Health and Wellness administers the Maternal and Child Health/Family Planning Programme which promotes reproductive health. The Family Planning Programme was integrated with the Maternal and Child Health Services in 1972. Family planning services are available, free of user cost, through a network of health service points.

11 JULY, WORLD POPULATION DAY 2019

25 YEARS OF ICPD: LOOKING BACK, LOOKING FORWARD

In 1989, the Governing Council of the United Nations Development Programme recommended that 11 July be observed by the international community as World Population Day, a day to focus attention on the urgency and importance of population issues. This year's World Population Day calls for global attention to the unfinished business of the 1994 International Conference on Population and Development (ICPD). Twenty-five years passed since that landmark conference, where 179 governments recognized that reproductive health and gender equality are essential for achieving sustainable development. November, UNFPA, together with the governments of Kenya and Denmark, will be convening a high-level conference in Nairobi to accelerate efforts to achieve these unmet goals. On World Population Day, advocates from around the world are calling on leaders, policymakers, grassroots organizers, institutions and others to help make reproductive health and rights a reality for all.
