

REPUBLIC OF MAURITIUS

FAMILY PLANNING & DEMOGRAPHIC YEARBOOK 2019

VOLUME 45
OCTOBER 2020

DEMOGRAPHIC/EVALUATION UNIT
MINISTRY OF HEALTH AND WELLNESS

FOREWORD

Over the last 50 years, family planning has created opportunities for women and girls to increase schooling, labor force participation, occupational choice, and wages, so they can build better lives for themselves and their families. For these reasons, family planning has often been called the key to sustainable development. Yet, more than 214 million women around the globe still have an unmet need for family planning—they want to limit or space their pregnancies but are not using contraceptives.

In Mauritius, family planning services, including contraceptive supplies, are available through a network of government health service points throughout the whole island and are free of user cost.

The Family Planning and Demographic Yearbook presents data on population trends and family planning use and accessibility, amongst others, for both Island of Mauritius and Island of Rodrigues. This yearbook is intended for planners, policy makers, and the general public.

The data presented in the yearbook has been obtained from the different departments of this Ministry (the Primary Health Care Division, the Health Statistics Unit, the Health Records Division, and the Human Resource Section) as well as from Statistics Mauritius and the non-governmental organisations, namely Mauritius Family Planning and Welfare Association and Action Familiale.

The yearbook has been published by the Demographic/Evaluation Unit of the Ministry of Health and Wellness, which is responsible for monitoring and evaluating the national family planning programme, and its present issue is the forty-fifth volume.

Special thanks go to the staff of the Demographic/Evaluation Unit of this Ministry for their assistance in the compilation of this yearbook and to the staff of other departments and organisations for providing statistics that have been published in this yearbook.

J. Sunkur

A SUMMARY ON THE DEMOGRAPHIC AND FAMILY PLANNING STATISTICS

A summary of the statistics presented in the 2019 Family Planning and Demographic Yearbook is given in this section. The 2019 Yearbook is the forty-fifth volume and provides statistics for Island of Mauritius and Island of Rodrigues on demography as well as on family planning for the government and the two non-governmental organisations, namely Mauritius Family Planning and Welfare Association and Action Familiale. The tables and charts in this volume have been grouped under the following headings: population, vital statistics, and family planning.

ISLAND OF MAURITIUS

CENSUS

The last two censuses have been carried out in 2000 and 2011, and the *de jure*¹ counts revealed that there were 1,143,069 inhabitants and 1,196,383 inhabitants respectively, and that the population density has increased from 613 inhabitants per square kilometre in 2000 to 642 in 2011 (*Table A.1*). Moreover, it is noted that the average annual population growth rate of 0.42% for the period 2000-2011 was lower than the annual growth rate of 1.12% for the earlier intercensal period 1990-2000.

POPULATION SIZE, GROWTH AND DISTRIBUTION

Island of Mauritius has registered a negative population growth rate of -0.04% in 2019 for the first time since post-independence. The estimated end-year population has declined from 1,222,208 in 2018 to 1,221,663 in 2019 (*Table A.6*).

¹ A population enumerated on the basis of normal residence, excluding temporary visitors but including residents temporarily absent.

Moreover, an estimate of 42% of the population lived in urban areas and 58% lived in rural areas in 2019.

SEX RATIO

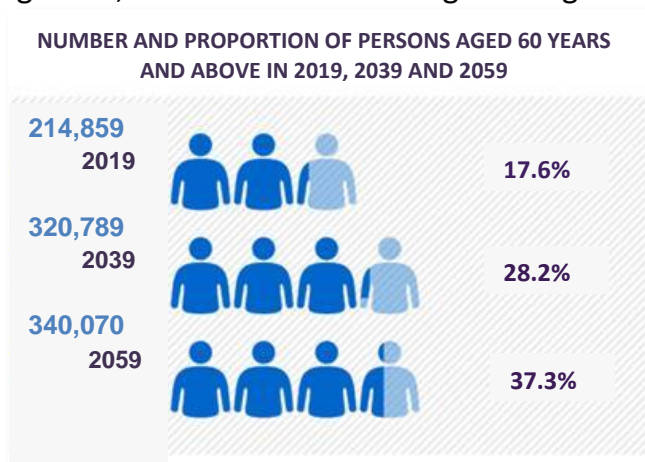

The sex ratio is a measure used to describe the balance between males and females in a population. In 2019, the sex ratio of the total population was 98.0 males per 100 females.

Due to the ‘female survival advantage’ in life expectancy, there are more females in the older age groups than in the younger age groups, and the gap increases with age. For instance, in 2019, there were 80.4 men per 100 women in the age group 60 and above and 53.9 men per 100 women in the age group 80 and above (*Chart 4*).

CHANGING AGE STRUCTURE

The population of Mauritius is ageing due to sustained low fertility level and increasing life expectancy, which in turn is resulting to lower proportion of children and higher proportion of elders in the population. The ageing index shows that there were about 102 elders aged 60 years and above for every 100 children younger than 15 years old in 2019. Hence, as the population is growing older, Mauritius is witnessing a change in its age structure..

The proportion of the population aged 60 years and above has increased from 9.1% of the total mid-year population in 2000 to 17.6% in 2019, and it is projected² to increase to 28.2% in 2039 and 37.3% in 2059 (*Chart 7*).

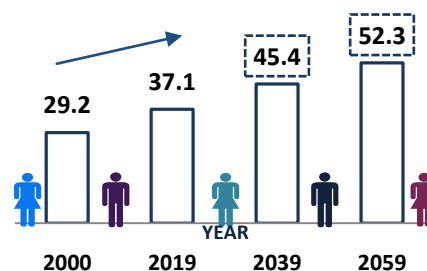

SHARE IN THE TOTAL POPULATION

² Medium variant projection based on 2019 population.

Conversely, the proportion of the population aged 0-14 years has decreased from 25.0% of the total mid-year population in 2000 to 17.2% in 2019, and it is projected to decrease to 13.3% in 2039 and 10.6% in 2059. The proportion of the population aged 15-59 years has remained almost constant (65.8% of the total mid-year population in 2000 and 65.2% in 2019), and it is projected to decrease to 58.5% in 2039 and 52.1% in 2059.

MEDIAN AGE OF THE POPULATION (IN YEARS)

Changes in the age structure are also reflected in the median age of the population; 50% of the population is older than this age and 50% is younger. The median age of the population has increased from 29.2 years in 2000 to 37.1 years in 2019, and it is projected to increase to 45.4 years in 2039 and 52.3 years in 2059.

Mauritius is also witnessing a progressive ageing of its older population. The share of persons aged 80 years or older in the elderly population (aged 60 years and above) is projected to increase from 11.2% in 2019 to 20.9% in 2059 (Chart 8). In other words, 1 in 9 elderly persons (aged 60 years or older) was 80 years or older in 2019, and this ratio is projected to be 1 in 5 in 2059.

Population pyramids are useful in examining the age-sex structure of a population. The juxtaposed population pyramids for year 2019 and 2059 show that due to the projected rise in the number and proportion of old people in the population, the apex of the 2059 pyramid is broader than that of the 2019 pyramid (Chart 13). Moreover, based on the projected changes in the age structure, there will be an increasingly demand for healthcare services for the elderly.

Another ramification of the changes in the age distribution is that the total dependency ratio will continue to increase. The total dependency ratio compares the number of dependents (children aged 0-14 years and elders aged 60 years and above) to the number of persons of working age (i.e. 15-59 years); a higher ratio indicates a higher burden on the working age population. The total dependency ratio has increased from 519.2 dependents per 1000 persons of working age in 2000 to 532.6 in 2019, and it is projected to increase to 710.6 in 2039 and 918.6 in 2059 (Table A.11).

WOMEN IN THE REPRODUCTIVE AGE GROUP (15-49 YEARS)

The number and proportion of women in the reproductive age group (15-49 years) are important demographic factors to consider in a reproductive health (including family planning) programme. The share of women in the reproductive age group (15-49 years) in the total mid-year female population was 49.7% in 2019, and it is projected to decrease to 42.1% in 2039 and 33.8% in 2059 (Chart 9).

LIFE EXPECTANCY

Life expectancy at birth has improved considerably and is expected to improve further over the years. It increased from 69.3 years in 1989-1991 to 74.2 years in 2017-2019 (Table A.7). Likewise, female life expectancy at birth increased from 73.4 years in 1989-1991 to 77.5 years in 2017-2019 and male life expectancy at birth increased from 65.6 years in 1989-1991 to 71.0 years in 2017-2019.

LIFE EXPECTANCY AT BIRTH (IN YEARS)
2017-2019

77.5

74.2

BOTH SEXES

71.0

WOMEN ARE LIVING LONGER THAN MEN

Life expectancy at birth is higher for females than for males but the gap between male and female life expectancy at birth is narrowing. The above-mentioned figures show that a girl born in 1989-1991 could expect to live 7.8 years longer than a boy born in the same period, and for a girl born in 2017-2019, she could expect to live 6.5 years longer.

Life expectancy at age 60 for the total population was 20.5 years in 2017-2019, and women aged 60 years in 2017-2019 could expect to live an additional 22.2 years, compared with 18.5 years for men aged 60 years in the same period.

VITAL STATISTICS

There were 12,056 live births and 10,911 deaths that were registered in 2019, resulting in a natural increase of 1,145 (live births minus deaths). Moreover, in 2019, there were 146 less live births and 390 more deaths than in 2018 (Table B.1).

The crude birth rate has declined from 11.8 births per 1,000 mid-year population in 2010 to 9.9 in 2019, and the crude death rate has increased from 7.3 deaths per 1,000 mid-year population in 2010 to 8.9 in 2019. Hence, the rate of natural increase was 4.5

in 2010 and 0.9 in 2019. Moreover, it is noted that the crude birth rate for the five-year period has declined, from 11.2 in 2010-2014 to 10.1 in 2015-2019. As for the crude death rate, it has fluctuated between 7.3 and 8.9 during the period of 2010-2019.

The infant mortality rate is often used as a proxy measure of the overall health of the population. There were 173 infant deaths (deaths under 1 year) that were registered in 2019, resulting to 5 more infant deaths than in 2018. The infant mortality rate has increased from 12.4 deaths per 1,000 live births in 2010 to 14.3 in 2019, resulting in an increase of 15.3%. Moreover, it is noted that the infant mortality rate for the five-year period has increased from 12.9 in 2010-2014 to 13.0 in 2015-2019.

The neonatal mortality rate is a key outcome indicator for newborn care and directly reflects prenatal, intrapartum, and neonatal care. During the period of 2010-2019, the neonatal mortality rate has fluctuated between 7.6 and 10.5 deaths per 1,000 live births; in 2019, this rate was 10.1. Neonatal deaths (deaths of babies under 28 days of age) accounted for 70.5% of all infant deaths in 2019.

The number of still births was 131 in 2019, which was higher than in 2018 (123). The still birth rate has fluctuated between 6.6 and 10.7 during the period of 2010-2019; the lowest rate ever-recorded was in 2010. In 2019, the still birth rate was 10.7 still births per 1,000 total births.

The under-five mortality rate is a leading indicator of child health and overall human development. The under-five mortality rate (deaths of children under five years of age) has increased from 14.6 deaths per 1,000 live births in 2010 to 15.8 in 2019, resulting in an increase of 8.2%. However, the data shows that the under-five year mortality rate for the five-year period has declined, from 15.1 in 2010-2014 to 14.9 in 2015-2019.

There has been a marked improvement in maternal health especially in the second half of the twentieth century (*Table B.2*). For instance, the maternal mortality ratio declined from 1.7 maternal deaths per 1,000 live births in 1970 to 0.2 in 2000. Factors such as strengthening and expanding the maternal and child health services, accessibility to

family planning services, and contraceptive use have been associated with this declining trend.

In 2019, the maternal mortality ratio was 0.66 maternal deaths per 1,000 live births (or 66 maternal deaths per 100,000 live births). It is noted that the maternal mortality ratio (i.e. maternal deaths per 1,000 live births) has fluctuated between 0.28 and 0.79 during the ten-year period of 2010 to 2019. As part of the renewed commitment from the government to improve further the reproductive health indicators, policies and strategies have been formulated and are being implemented.

VITAL STATISTICS BY DISTRICT³

In 2019, the crude birth rates ranged from 8.0 in Flacq to 14.2 in Port Louis (*Table B.3*). Three districts had higher rates (Port Louis, Pamplemousses, and Savanne) than the national level of 9.9.

In 2019, the crude death rates ranged from 6.4 in Black River to 11.9 in Port Louis (*Table B.4*). Three districts had higher rates (Port Louis, Grand Port and Plaines Wilhems) than the national level of 8.9.

In 2019, the still birth rates ranged from 6.8 in Rivière du Rempart to 19.5 in Savanne (*Table B.5*). Five districts had higher rates (Port Louis, Pamplemousses, Flacq, Savanne and Black River) than the national level of 10.7.

In 2019, the infant mortality rates ranged from 7.2 in Flacq to 18.6 in Pamplemousses (*Table B.6*). Five districts had higher rates (Pamplemousses, Savanne, Plaines Wilhems, Moka and Black River) than the national level of 14.3.

³ Island of Mauritius is divided into nine districts (see map).

FERTILITY

There has been a remarkable decline in fertility in the past few decades as measured by the total fertility rate. The total fertility rate is the average number of babies that a woman could expect to bear if current fertility rates prevail throughout her reproductive lifetime. The total fertility rate dropped sharply from 5.86 children per woman in 1962 to 3.42 in 1972 and continued to drop further thereafter.

The total fertility rate dropped below the replacement-level fertility of 2.10 children per woman - the level needed for a woman to replace herself and her partner - for the first time in the mid-1980s; however, it was not until 1997 onward that fertility has continuously been at sub-replacement level. In 2019, the total fertility rate was 1.35 children per woman compared with 1.54 in 2010, resulting in a decrease of 12.3% (*Table B.7*).

TOTAL FERTILITY RATE
1.35
AT SUB-REPLACEMENT LEVEL
IN 2019

In 2019, women in the age-groups 15-19, 20-24 and 25-29 had lower fertility rates than women in the same age group in 2010 (*Table B.8*), and the largest percentage decrease in fertility rates were among women aged 20-24 years (38.0%).

Early childbearing increases health risks for both mothers and their newborns. The fertility rate for women aged 15-19 years (adolescent fertility rate) has declined from 30.7 in 2010 to 22.2 in 2019, resulting in a decline of 27.7%. Even though progress has been made in reducing the fertility rate among adolescents, it is noted that 31 live births occurred to adolescents under 15 years of age in 2019.

In 2019, the age-specific fertility rates showed that women *aged 25-29 years* had the *highest* fertility rate (80.7) among all age groups, and that women *aged 30-34 years* (73.1) and women *aged 20-24 years* (52.1) had the *second* and *third* highest fertility rate respectively (*Table B.8*).

The median age of childbearing has increased from 28.7 years in 2018 to 28.8 years in 2019.

NUPTIALITY

Island of Mauritius

The 1962 and 1972 censuses showed that the proportion of currently married women in the age group 15-19 declined by slightly more than half, from 27.8% in 1962 to 12.5% in 1972 (*Table A.3*) whilst the average number of children per woman dropped from about 6 to 3 in the same period. Factors that have been linked to this sharp reduction in fertility between 1962 and 1972 include, among others, the postponement of marriage among younger women and contraceptive use. The last census, which was carried out in 2011, revealed that the proportions of currently married women in the age group 15-19 and 20-24 were 6.3% and 34.8% respectively.

The crude marriage rate has declined from 17.1 marriages per 1,000 mid-year population in 2010 to 15.5 in 2019, resulting in a drop of 9.4%. There were 9,501 marriages that were registered in the Island of Mauritius in 2019, and the majority of brides (82.4%) and bridegrooms (83.3%) had never been married before.

The median age of females and males at first marriage was 27.49 years and 30.22 years respectively in the Island of Mauritius in 2019. The median age at first marriage for females has increased by 0.14 years since 2018 and the median age at first marriage for males has increased by 0.25 years since 2018.

Republic of Mauritius

The data shows that 2,425 divorces and 2,174 divorces have been granted in 2018 and 2019 respectively in the Republic of Mauritius. The crude divorce rate ranged between 2.5 to 3.8 during the period of 2010-2019 (*Chart 18*). In 2019, the crude divorce rate was 3.4 divorces per 1,000 mid-year population. Overall, 64.4% of all couples granted divorce in 2019 had at least one dependent child.

The crude marriage rate for the Republic of Mauritius ranged between 15.2 and 16.9 for the period of 2010-2019.

FAMILY PLANNING

Availability

Family planning helps save women's and children's lives by preventing unplanned pregnancies. Family planning services, including contraceptives, have been available to individuals and couples, free of user cost at government health service points since 1968.

The government family planning programme provides a wide range of short-term and long-term contraceptive methods⁴ through a network of health service points.

However, availability of family planning services in Mauritius dates back since 1957 when the non-governmental organization (NGO) Mauritius Family Planning and Welfare Association (MFPWA) was set up. The MFPWA family planning programme was then integrated with the government maternal and child health programme in 1972, and thereafter, MFPWA has continued to run a family planning clinic where contraceptive methods and counselling services are offered. Moreover, the NGO Action Familiale, which was established in 1963, has been promoting use of natural family planning methods and has been providing counselling services.

There is a concerted effort between the Government, MFPWA, and Action Familiale to provide family planning services. The national family planning programme has long shifted its focus from achieving demographic targets to improving the reproductive health of the population. However, since its inception, the guiding principle of the family programme has been that all couples and individuals have the basic right to decide freely and responsibly the number, spacing, and timing of their children.

FAMILY PLANNING BENEFITS

- **Advances human rights**
- **Saves lives**
- **Prevents HIV/AIDS transmission**
- **Helps reduce poverty**
- **Advances gender equality and empowerment**
- **Supports the achievement of the sustainable development goals (SDGs)**

⁴ The short-term contraceptive methods are male condom; female condom; pill; 1-month injectable; and 3-month injectable, and the long-term contraceptive methods are implant; IUD; and tubal ligation. Emergency contraceptive pills are also available.

Family Planning Clients⁵

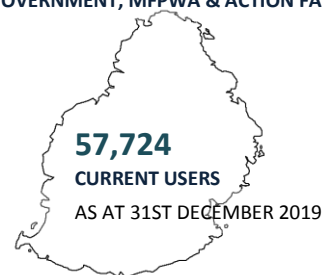

New Acceptors

In 2019, there were 3,577 new acceptors who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Mauritius (*Table C.1*). This figure includes 500 new acceptors of tubal ligation reported at government hospitals. Three-month injectable was the most preferred method among the new acceptors accounting for 21.58%, followed by male condom (20.74%), sympto-thermal (19.57%), pill (17.36%), tubal ligation (14.0%), 1-month injectable (3.58%), IUD (2.04%), and implant (1.12%).

Current Users

As at 31st December 2019, there were 57,724 current users who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Mauritius (*Table C.11*). This figure includes 13,547 current users of tubal ligation reported at government hospitals.

FAMILY PLANNING PROGRAMME
(GOVERNMENT, MFPWA & ACTION FAMILIALE)

Sympto-thermal was the most preferred method among the current users accounting for 46.25%, followed by tubal ligation (24.69%), male condom (11.55%), pill (6.75%), 3-month injectable (5.13%), IUD (3.21%), implant (1.59%), and 1-month injectable (0.84%).

The yearly average number of current users for the five-year period has declined from 69,555 in 2010-2014 to 60,521 in 2015-2019 (*Table C.10*), resulting in a decline of 13.0%.

⁵ There are different types of family planning clients, and they include new acceptors and current users. A new acceptor is someone who accepts a contraceptive method for the first time from a provider of a family planning programme. A current user is someone who uses a method of contraception that has been obtained from the provider of the family planning programme. It should be pointed out that since the number of family planning clients of female condom in the government is small; it has been excluded in this section (In 2019: 3 new acceptors and 5 current users for Island of Mauritius).

Moreover, the programme-based statistics (for the government, MFPWA, and Action Familiale) shows that 18.8% of women aged 15-49 years and 30.4% of currently married aged 15-49 years were using a contraceptive method in 2019. However, the Contraceptive Prevalence Survey, which was carried out in 2014, showed that higher proportions of women (40.9%) aged 15-49 years and of currently married women (63.8%) aged 15-49 years were using a contraceptive method in the Island of Mauritius. This nationwide survey revealed that women in the reproductive age group 15-49 years were obtaining their contraceptive method either from programme sources (government and NGOs) or from non-programme sources (e.g. pills from pharmacies) or were using non-programme methods (such as withdrawal).

Accessibility and Attendance

Government family planning services are available through an extensive network of health service points, covering the whole island of Mauritius⁶ (*Appendix III*). Presently, there are 153 government family planning service points: 1 Community Hospital; 6 Medi-Clinics; 21 Area Health Centres; 115 Community Health Centres; 2 Family Health Clinics; 3 Family Planning Clinics; and 5 Industrial Family Supply Centres. Hence, in relation to the population size, there were about 2,007 women in the reproductive age group (15-49 years) per government family planning service point.

In 2019, a total number of 50,412 attendances have been recorded at the government family planning service points.

In 2019, seven family planning clinics provided services after working hours, on Sundays and on public holidays.

⁶ For administrative purposes, five health regions have been established by the Ministry of Health and Wellness of Life.

ISLAND OF RODRIGUES

VITAL STATISTICS

There were 806 live births and 263 deaths that were registered in 2019 (Table F.1). The crude birth rate was 18.6 births per 1,000 mid-year population and the crude death rate was 6.1 deaths per 1,000 mid-year population in 2019. Hence, the rate of natural increase was 12.5 in 2019.

The crude birth rate has increased from 17.8 births per 1,000 live births in 2010 to 18.4 in 2018 and in 2019, it was 18.6.

The infant mortality rate has increased from 15.0 deaths per 1,000 live births in 2010 to 18.1 in 2018 and in 2019, it was 17.4.

The still birth rate has increased from 7.4 still births per 1,000 total births in 2010 to 9.2 in 2018 and in 2019, it was 9.8.

The total fertility rate has declined from 3.19 children per woman in 1990 to 2.48 in 2018 and in 2019, it was 2.50 (Table F.2). In 2019, the age-specific fertility rates showed that women *aged 25-29 years* had the *highest* fertility rate (130.6) among all age groups and that women *aged 30-34 years* (108.1) had the *second* highest fertility rate (Table F.3).

FAMILY PLANNING

Family Planning Clients⁷

New Acceptors

In 2019, there were 267 new acceptors who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Rodrigues (Table F.4). Three-month injectable was the most preferred method among

⁷ Refer to footnote 5 for types of family planning clients. It should be pointed out that since the number of family planning clients of female condom in the government is small; it has been excluded in this section (In 2019: 0 new acceptors and current users for Island of Rodrigues).

the new acceptors, accounting for 38.2%, followed by pill (33.7%) and male condom (12.4%).

Current Users

As at 31st December 2019, there were 3,988 current users who were registered at the family planning service points of the government, MFPWA, and Action Familiale in the Island of Rodrigues (*Table F.5*). Pill was the most preferred method among the current users accounting for 30.5%, followed by sympto-thermal (27.3%), 3-month injectable (14.4%), male condom (13.4%), implant (7.4%), tubal ligation (3.9%), and IUD (3.1%).

FAMILY PLANNING PROGRAMME (GOVERNMENT, MFPWA & ACTION FAMILIALE)

Family Planning Service Points

In 2019, there were 15 government family planning service points in the Island of Rodrigues (*Table F.6*). Hence, in relation to the population size, there were about 754 women in the reproductive age group (15-49 years) per government family planning service point.

Attendance

In 2019, a total number of 11,332 attendances have been recorded at the government family planning service points.

[@] Registered live births per 1,000 mid-year population.

[#] Live births per 1,000 women aged 15-49 years.

^{**} The average number of children born to a woman assuming that she survives to the end of her childbearing age and is subjected to a fixed schedule of age-specific fertility rates.

[^] The average number of daughters born to a woman assuming that she survives to her childbearing age and is subjected to a fixed schedule of age-specific fertility rates.

⁺ The average number of daughters that would be born to a woman during her lifetime if she passed through all her childbearing years conforming to a fixed schedule of age-specific fertility rates and age-specific mortality rates.

[~] Live births occurred per 1,000 women in each age-group.

Glossary

Population

Census	The total process of collecting, compiling and publishing data on the demographic, social and economic situation of all persons in a specified territory at a particular time. Decennial censuses are usually the norm.
De facto population	A population enumerated or estimated on the basis of those present at a particular time, including temporary visitors but excluding residents temporarily absent.
De jure population	A population enumerated or estimated on the basis of normal residence, excluding temporary visitors but including residents temporarily absent.
Density of population	A ratio of the number of people to the area of land that they occupy usually given as number of persons per square kilometer of area.
Natural increase	The excess of births over deaths.
Rate of natural increase	The difference between births and deaths occurring in a year per 1000 mid-year population. This rate is the difference between the 'crude birth rate' and the 'crude death rate'.
Population growth	The change in population size due to the three demographic processes, namely births, deaths, and migration.
Doubling time	The number of years it would take for the population to double its current size at the current annual rate of growth.
Net external migration	The difference between international departure and arrivals of residents.

Age structure

Sex ratio	The number of males per 100 females in a population.
Total dependency ratio	The combined child population (below 15 years) and older population (aged 60 years and above) per 1,000 population of working age (i.e. 15-59 years).
Young-age dependency ratio (per 1000)	The ratio of the number of persons aged less than 15 years to the number of persons of working age (i.e. 15-59 years old).
Old-age dependency ratio (per 1000)	The ratio of the number of persons aged 60 years and above to the number of persons of working age (i.e. 15-59 years old).
Median age	The age that divides a population in two parts of equal size: i.e., there are as many persons with ages above the median age as there are with ages below the median age.
Population pyramid	A graphic that portrays the age-sex distribution of the population.

Fertility

Crude birth rate	The number of live births registered in a year per thousand estimated mid-year population.
Fertility	The childbearing performance of individuals, couples, groups or populations. It is contrasted with FECUNDITY, the theoretical capacity which may or may not lead to fertility.
General fertility rate	The number of live births occurring in a year per thousand estimated mid-year female population in their childbearing age (15-49 years).
Age-specific fertility rate	The number of live births occurring to women of a particular age or age group per year, normally expressed per 1,000 women. Five-year age groups from 15-19 to 45-49 are most commonly used.
Total fertility rate	The average number of <i>children</i> that would be born to a woman assuming that she survives to the end of her childbearing age and is subjected to a fixed schedule of age-specific fertility rates.
Gross reproduction rate	The average number of <i>daughters</i> that would be born to a woman assuming that she survives to the end of her childbearing age and is subjected to a fixed schedule of <i>age-specific fertility rates</i> . This is similar to the total fertility rate except that the gross reproduction rate counts only daughters.
Net Reproduction Rate	The average number of <i>daughters</i> that would be born to a woman during her lifetime if she passed through all her childbearing years conforming to a fixed schedule of <i>age-specific fertility rates and age-specific mortality rates</i> . The net reproduction rate is closely related to gross reproduction rate employing the same data on fertility but also indicating the effects of mortality.
Replacement level fertility	The level of fertility at which a population exactly replaces itself from one generation to the next and it is taken to be an average of 2.1 children per woman. Alternatively, a net reproduction rate of 1.0 denotes replacement level fertility; the women are having just enough daughters to "replace" themselves in the population.
Mean age of Childbearing	The average age of mothers at the time of birth
Live birth order	The ordinal number of a given live birth in relation to all previous live births of the same woman.

Nuptiality

Marriage rate	The annual number of men and women marrying per thousand mid-year population
Divorce rate	The annual number of men and women divorcing per thousand mid-year population.

Mortality

Crude death rate	The number of deaths in a year per 1,000 mid-year population.
Infant deaths	The number of deaths occurring to children less than one year of age (0 - 364 days).
Infant mortality rate	The number of infant deaths in a year per 1,000 live births in the same year.
Child mortality rate	The number of deaths of children aged between one year and five years (1-4 years) in a year per 1,000 mid-year population aged between one year and five years (1-4 years) in the same year.
Under five mortality rate	The number of deaths of children aged under five years (0-4 years) in a year per 1,000 live births in the same year.
Still birth	The expulsion or extraction from the mother of a dead foetus after the time at which it would normally be presumed capable of independent extra uterine existence. This is taken to be at or after 28 weeks duration of pregnancy.
Still birth rate	The number of still births in a year per 1,000 total births (live births and still births).
Early neonatal mortality rate	The number of deaths of infants under one week (0-6 days) of age in a year per 1,000 live births in the same year.
Late neonatal mortality rate	The number of deaths of infants aged between one week and four weeks (7-27 days) in a year per 1,000 live births in the same year.
Neonatal mortality rate	The number of deaths of infants aged under four weeks (0-27 days) in a year per 1,000 live births in the same year.
Post neonatal mortality rate	The number of deaths of infants aged between four weeks and one year (28-364 days) in a year per 1,000 live births in the same year.
Perinatal mortality rate	The sum of the number of deaths of children aged under 7 days and the number of still births in a year per 1,000 total births (live births and still births) in the same year.
Maternal mortality	Mortality from causes connected with pregnancy, labour or the purperium (lying-in period).
Maternal mortality ratio	Number of deaths connected with pregnancy, labour or the purperium divided by the number of live births and expressed per 1000 or 100,000.
Life expectancy at birth	The average number of years a newborn can expect to live based on the mortality conditions at the time.

Family Planning Clients & Activities

New acceptor	Someone who accepts a contraceptive method for the first time from a provider of a family planning programme.
Current User	A new acceptor who continues with the same or different method of contraception and pays regular return visits to the family planning service point to receive services and supplies.
Drop out	A current user who does not show up at scheduled appointment or thereafter within a defined period (according to the contraceptive method) for services and contraceptive resupplies at a family planning service point.
Drop out returnee	A client who starts receiving again the services and supplies available at the family planning service point after temporarily failing to pay return visits at the service point.
Canvassing	The purpose of canvassing is to seek potential clients who will benefit from information and services at a family planning service point.
Follow-Up	The purpose of follow ups is to remind clients that they have missed a scheduled appointment and to encourage them to make a return visit to the family planning service point.
Session	Field visits made by community health worker for canvassing and follow-ups.

Organisations and Acronyms

ACTION FAMILIALE (A. F.)	Action Familiale, a non-governmental organisation, was established in 1963 at the initiative of Mgr J. Margeot, then Vicar General of the Mauritian Catholic Diocese. Besides, promoting sympto-thermal, which is a modern natural family planning method, Action Familiale provides a wide range of services which includes counselling services to couples and youth.
MAURITIUS FAMILY PLANNING & WELFARE ASSOCIATION (MFPWA)	The MFPWA, a non-governmental organisation, was set up in 1957 by some volunteers who believed that the rampant population growth rate would hinder social and economic development in Mauritius. The MFPWA promotes modern methods of contraception and is involved in many family planning, women empowerment and advocacy related activities.
MATERNAL AND CHILD HEALTH/ FAMILY PLANNING (MCH/FP)	The Ministry of Health and Wellness administers the Maternal and Child Health/Family Planning Programme which promotes reproductive health. The Family Planning Programme was integrated with the Maternal and Child Health Services in 1972. Family planning services are available, free of user cost, through a network of health service points.

PUTTING THE BREAKS ON COVID-19: HOW TO SAFEGUARD THE HEALTH AND RIGHTS OF WOMEN AND GIRLS NOW

The COVID-19 crisis has taken a staggering toll on people, communities and economies everywhere. But not everyone is affected equally. Women, who account for the largest share of front-line health workers, for example, are disproportionately exposed to the coronavirus. Supply chains around the world are being disrupted, impacting the availability of contraceptives and heightening the risk of unintended pregnancy. As countries are on lockdown and health systems struggle to cope, sexual and reproductive health services are being sidelined and gender-based violence is on the rise.

Recent UNFPA research highlighted that if the lockdown continues for 6 months with major disruptions to health services, then 47 million women in low- and middle-income countries may not be able to access modern contraceptives resulting in 7 million unintended pregnancies. 31 million additional cases of gender-based violence can also be expected. The disruption of UNFPA's programmes on the ground could result in 2 million cases of female genital mutilation and 13 million child marriages between 2020 and 2030 that could have been averted.
